I would if I could, but I am so beat down over being in court and advocacy that I am about ready to blow my brains out.

Current case I have with the Cal State Court of appeals; if I lose it, it will open the door to never ending divorce settlements. Ex-wife managed to reopen my divorce settlement for stock option granted post divorce ~20 years after intial divorce.

It will be the law, it will not be something I am in favor of, but I just can't fight anymore. I have been sued for everything from a woman getting a finger ripped off in a tabletting machine I voted against buying to getting accused by police of being a bike thief because someone I sold a truck to did not change the registration. Only had 2 years since 1978 I have not been in court and as many as 5 cases going on at the same time. And I am a nice guy.

I have had it.

I can't believe this thread is *still* alive with people answering this
rhetorical question, which I posed over a month ago.

Folks: 90% of all PCs are running some form of Windows. Semantic
anecdotes about people who still use DOS are unnecessary - don't you
recognize rhetoric when you see it? The point was: someone was talking
about a deficiency of the PC, it was pointed out that there was no such
known deficiency, and the original someone came back with, "I was
talking about DOS". In this day and age, the response, "Who the ****
uses DOS anymore" was meant to indicate: "Using a deficiency of DOS to
point out the shortcomings of the modern-day PC is like using a
deficiency of the Edsel to point out the shortcomings of the modern-day
automobile".

Of course *some* people still use DOS. But they are so few that their
significance is negligible to the point at hand. Remember, this was all
about an argument that the *Jaguar* is the premeire gaming machine today
- better than a Playstation, better than a PC. Well yeah, I guess a
Jaguar is superior to a 386, which was about the last time DOS was in
widespread use.

I didn't think it needed to be spelled out like that, but there you have
it....

Mike

I think precedence might be a little shaky on this point. Look at this page, which contains descriptions and outcomes of the major look-and-feel cases: http://www.computerlaw.com/lookfeel.html

But legal issues aside, what Hasbro's doing just plain BUGS me. These classic games seeded what has become a gigantic video game industry. On the family tree of video games, Pac-Man and Asteroids surely hold distinguished positions at the root. It's as if Capitol Records started suing pop bands that sounded like the Beatles, even if the songs were different. Hasbro should treat the ownership of these games as museum pieces to cherish, not as a collection of legal sledgehammers used to advance their market position.

I know, I should hardly expect a big, old company like Hasbro to behave "respectfully". But I am one of those who perceives video games as a form of expression, and I view any attempt to prevent expression as harmful to the entire industry. Hasbro, just because your Asteroids reissue sucked doesn't mean you need to kill off everyone else's games!

Also, I'd like to ask readers of this newsgroup to submit this story to Slashdot -- they didn't run it when I posted it, and I think it's important that everyone be aware of this case.

Don't feel too bad. It seems I end up in court a couple of times a year...
So far I've won 100%. Even tho its scary when you are looking down at what
you can lose...

With Hasbro (or should I say Hasbeen) its a sneaky game of who blinks first.
Technically, most cases are settled with neither side 'admitting guilt' that
way the case cannot be used to bolster further cases. Look and feel cases
are tough to prosecute and tougher to win if you have no money to back it
up, however, its tough to prosecute a company that is chartered outside the
US. Anyone who puts out a product 'remotely' similar to another and is
based in the USA runs the risk of look and feel.

I say, allow Hasbro to file and follow as many look and feel's that it can.
It will only affect their bottom line by hurting themselves. Eventually,
their own management will tire of spending $100 to save $10 and will put the
kabosh on their litigative ways...

Updated as of 03/05/00
New items added

I have a limited amount of brand new Atari Jaguar items for sale or trade. These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping.

If you are interested in any of these items, please respond to me by using this automated link jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (all contain one controller, RF Box and AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $50
- Atari Jaguar with CyberMorph cartridge $40
- Atari Jaguar (No Cart) $30

** Atari Jaguar Accessories - New**
==========
- Jaguar unit alone (No power supply, controller or accessories) $20
- Composite Video Cable $15
- Spare Controller $15
- AC Power Supply $15
- RF Switch Box $10

** Atari Jaguar Games - New/Shrink-wrapped**
==========
- Checkered Flag $10
- CyberMorph $5 (No Box)

Atari Force Comics Please make an offer
==========
All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for rare or shrink-wrapped/sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- A working SONY SAT-A50 DSS Satellite Receiver
- Working DSS H or HU Cards
- And of course the ever popular, original Intellivision keyboard (should I be so lucky :).

I see videogames as similar to music copyright.

How often have you heard a song used in advertising that is almost identical to a trendy pop song? For instance, right now there is an ad that has something that has the beat and instrumentation of "Bittersweet Symphony" (a song that in turn rips off the Rolling Stones, BTW) complete with the drum intro part but since the notes are different enough, they can avoid a lawsuit. The advertisers benefit from the mental recognition that they almost feel like they are hearing the song, but the producers of the commercial avoid having to pay any sort of licensing fees for Bittersweet Symphony.

This is a kind of music industry "bottom feeder" genre that has existed for quite some time. The industry has tolerated it.

Movies are another example.

Right around the time of Jurassic Park, Roger Corman released "Carnosaur". Also, whenever Disney releases a movie based on a public domain or biographical source (like Pocahontas) you suddenly see a lot of stale old cartoons pop up out of nowhere with Disney-like packaging. When Titanic came out, there was that TV movie and tons of documentary videos.

>harmful to the entire industry. Hasbro, just because your Asteroids
>reissue sucked doesn't mean you need to kill off everyone else's games!

Wasn't it Activision that rehashed Asteroids?

This raises another issue. Hasbro acquired the Atari rights. They licensed the Frogger rights (I doubt they own it lock stock and barrel). What they are doing is defending the rights to games they didn't even create and in some cases don't own but merely have an exclusive license to certain platforms (which may also be temporary).

That's something I thought was disturbing way back when with the Pac Man vs. Jawbreaker case. Atari Inc. didn't make Pac Man. Namco did. But since Atari paid shitloads for the home rights, they basically acted as defenders of Namco's look and feel rather than their own.

Source record: 46258

>I have never been able to get SIO2PC or APE and a real SIO floppy drive to work on my systems at the same time. <

Well, I have made some progress, and the
above statement is no longer true!
Long story short -- I rebuilt my 1489 cable to
the diagram shown at http://www.redshift.com/~cdyson/atari.html
(Thanks, Clarence!)
But with one added change (#3):
1) Substituted a 14C89 for the 1489, and this
made an immediate difference.
2) Changed a 0.1 uF disc capacitor to a
Tantalum of the same value.
3) Raised the resistor value to 10K from 5.6K.
4) Added the jumper from Pin 13 to ground.
Item 2 didn't seem to make much difference,
while 3&4 did. Now I can use an several
different drives with the interface at standard
speed. Warp speed with a 1050 Happy is
so far still unreliable, but I have other
combinations yet to try. Progress!
LW

>I did have an Atari vendor ask me years ago if he could copy my interface
>for sale and advise people to download my software to make it go. I said,
>"I'd rather you didn't", and as far as I know--he didn't.

OK, i am neither big nor vendor; i didnt ask you - mea culpa, maybe i should. But then again i didnt fell like i am doing anything inappropriate - as you sayed people are free to make the hardware all by themselfs. What if they choose to pay somebody to make it for them? And i am really not making any significant amount of money on it - you can easily check it on ebay.

And the last point: i could easily defend myself by saying that the cable i am selling has nothing to do with your software and the name is just a coincidence... I am NOT doing that - the design is yours and the software you wrote is excellent; you certainly deserve to be payed for it. However i dont see how can i do you better NOT helping people to make those cables? I always thought the more people will have it the more money you will get anyway. If it is not so then sorry... Maybe you should have done somethig like Steven Tucker did - cripple the freely distributable version of the software in some way... I don know. Maybe you should have agreed for the big vendor's propositon for a fee?

Hi,
I have a Sega 'SC-3000H' console for auction at www.ebay.com
This is the early Sega personal computer with a quality mechanical
keyboard, before the 'SC-3000' which was supplied with a rubber-membrane
keyboard.

Accessories include the Packing carton, PSU, Data recorder, joy-stick,
Basic ROM cart IIIA, Basic ROM cart IIIB, Game ROM: Sinbad Mystery and
game ROM: Starjacker.

Can be viewed here:
http://www.ozemail.com.au/~oznerol/march/basic1.jpg

Thanks for looking.

Yeah, they must not own Frogger, because they would be prosecuting it if
they did ... I remember seeing a game on the shelves at Best Buy called
"3D Frog Frenzy" or something similar.

1551. Atari 3.5" drive compatibility Question

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-05 00:00:00 UTC
From: Nir Dary <ndary@bigfoot.com>
Message-ID: <89u1fvnqr1@news.netvision.net.il>
Source record: 46262

few years ago I used to have a modified 3.5" (720k) xf551 drive, and saved few floppies from that time.

Last Week received the Floppy Board, and connected a 3.5" (1.4meg) high density drive on it, I was managed to format 3.5" high density floppies on it and it worked very fast!!!

to my surprise I was also able to read the 720k floppies I made few year ago without changing any settings and using the High density drive mechanics.

does any one knows what would happen if I take a high density floppy and format it as dd (720k) would the 3.5" modified xf551 will be able to read it?

The key is the exclusive rights clause. When a company pays to be the
only one doing a home version for a given platform, they don't want anyone
else making money off that element. Similar games mean someone else is
making money they paid dearly to be the only version of. If Atari paid,
they in turn want Magnavox to pay. If Hasbought paid, they want everyone
else to pay. And to not make any more money at the same time.

depends on the disk.

I am aware of three densities on that size disk.
single density (360k)
double density (720k)
and high density (1440k) (usualy marked with a stylised HD on the case)

untill a couple of years ago you could format a higher density disk to a lower density format without problems. However over the last 3 years or so it has become difficult to find such disks (change in manufacturing process?). you cannot format a dd disk to hd format, it just wont take it. but you can format an older hd disk to a dd or sd format, but they are getting harder to find.
I know this as I did have an old 386 laptop that only worked with 720 disks, but it would not format 1440s as 720s, nor could I get any pc to do so with the newer disks.

IMO: This would never hurt if you can find the 14C89 or 75C189.
> 2) Changed a 0.1 uF disc capacitor to a
> Tantalum of the same value.
You could have had a leaky cap in the first board. Sometimes they ~short and
it doesn't do your power supply any good. But a new disc cap vs tantalum
should have worked just as good if that was the problem.
> 3) Raised the resistor value to 10K from 5.6K.
IMO: I'm still not sure this does anything for a properly functioning Atari.
In the absence of schematics for the MB or on chip silicon of the POKEY, I
hope Atari engineers took care of this already.

That is, they have a high impedance input that may or may not have a device
plugged into it. In order for the system to boot properly with nothing
plugged in, they must<should> have this input pulled up or down.
> 4) Added the jumper from Pin 13 to ground.
This is just an input for the 1489 series. It is pulled up on the silicon so
it won't oscillate with NC. IIRC, tying it low should decrease the amount of
current the 1489 draws, but unless you have something like a shorted cap or
a 1200XL, it shouldn't make a dif.

you
> wrote is excellent; you certainly deserve to be payed for it. However i
dont
Technically the design may be mine, but only sort of. You are doing the 1489
version of the cable right?

Let me explain.

The Supra Rverter SIO to RS232 cable preceeded everything else, so the SIO
to RS232 was not a new idea. I still don't know what chip they use in that
puppy, but for all I know it could be a 1489. Ken Siders duplicated
functionality of it with a MAX232, but could have done it with a 1489 if he
felt like it.

There was also a software program and interface that was shown/demo'ed to me
by Kyle Dain around 1990 or so
I would guess. SIO2CP/M! At the time he said ~"Single chip" and I think "1
passive componet" but I am not sure about the latter. It could very well be
that it was a 1489/small signal diode like I later used. In other words,
Nick happened to hit on the same idea the CP/M groupie had done, and I
happened to use the same chip same said CP/M groupie had used.

Punch line to all this is the 1489 cable is both a trivial and obvious
design. When I say I designed the 1489 version of the cable, what I really
mean is "I think I did". Only thing that can be said for sure is I started
posting the design around for people to use.
> see how can i do you better NOT helping people to make those cables?
IMO, you aren't hurting. The failure is people that don't pay shareware fees
which is beyond your control. All you are doing is making it possible for
more people to "not pay shareware fees" which isn't exactly a crime. I mean
if you hosted an ftp site that provided shareware programs, it would have
the same consequences.

Small sample, but the reason why I started doing redoing the cable design
was because 70% of the people attempting to make a MAX232 version failed.
After fixing a dozen cables or so, I got bored. I mean I could make the MAX
version and fix everyones broken cable, but I didn't want to make ANY
version, so simplier/fault tolerant design.
****
But people are getting smarter about intellectual property rights. For
instance, a reasonable system would be something like: Every SIO2PC type
cable carries with it a $2 fee that goes to the software authors. Steve and

Nick each get a buck for each cable sold. The basic design does not make a difference, but since they will mostly be used with APE and SIO2PC...
****

I'm not sure how it would effect me since I have a tendancy to give away cables or just ask to get reimbursed for costs. But sheesh! Right now if someone offered me $100 for a Prosys cable I wouldn't do it. I couldn't even make 3 cables the same way, I was so bored I made 3 different type designs. I thought after a ~6 year layoff I would be ready to make a few simple things, but I was wrong.

But if Nick or Steve tell me "Don't give away a cable unless I get a buck", with the exception of the ST users, I would comply: Made enough of the damn things that any excuse to stop making them is good enough!

Hi Nir-
(long post!)
>>Does any one knows what would happen
if I take a high density floppy and format it
as dd (720k) <<
Part I:
It probably won't work well. Because the
data density is much higher on a HD disk,
the magnetic media requires a higher write
current to properly magnetize the particles.
In turn, once magnetized, the media does
not quickly demagnetize itself though the
magnetic poles are closer together. But what
you are planning would take the "high
coercivity" media, and attempt to magnetize it with the lower write current of
a DD setting.
One would expect bad sectors and sectors
that become unreadable fairly quickly.
But -- it is not as blatant as taking a HD 5-1/4
disk and trying to format it on a DD drive.
There are probably some disks that this
would work on, but what ones? New disks
would be better, since writing with lower
write current over existing data would add
another potential problem. Last (and I don't
know if this can be done) if you could trick
the drive into using the higher write
current, but the lower data rate, the chances
for success should increase. So the
"correct answer" is still "not recommended",
unless you did it on an experimental basis,
ans willing to lose data down the road.
Part II:
If the FB can write it, then the XF should
read it, but the skew on the FB is shorter
(faster), so the XF would read slowly
unless you use standard (slow) skew.
Also, depending on the mechanism used,
you might have to take a piece of tape to
cover up the HD media sensor hole, and
sometimes tape causes disks to hang in a
3-1/2" mechanism.
Good luck if you try it.
Larry

Glenn,

More interesting, I emailed the seller and asked a few simple questions like is the case cosmetically sound? (such as having screws coming out of the sides or is the case is perfect condition), is the unit in working condition? Does the disk drive work or is it just a regular 1050 installed for show? Its been about 3-4 days and not a single respond, so even though I have no interest in bidding, I do find my opinion of the auction to be a little bit on the skeptical side. However the auction has stirred up a lot of interest and someone is going to make a lot of money, I just hope the winner doesn't get stuck with a lemon.

Although those disks look the same and fit in the same drives they are
not the same. Look for the "HD" imprint in the lower left. You should
not format an HD diskette at 720k. I believe it has to do with the
magnetic particles configuration on the disk surface.

However all floppy drives at 1440k should be able to read the lower
capacity diskettes.

The biggest problem with the Saturn was that it had no transparancy which
seems insane in hindsight. Also, like the Jag, it is/was a pig to program
whereas the PSX came with a full library of routines/support tools.

FWIW, I bought a Jag & Saturn and watched them both die whereas my friends
all bought Playstations and still get to play new games to this day.
Considering the hardware, Driver is very impressive on the PSX.

Curt,

The seller answered your questions by adding info on the auction page itself. Apparently everyone wanted to know the same things. Don't find that suspicious. That flea market story, though - an insider that Atari mailed a prerelease version doesn't know that a 1450XLD is worth something? Hmm. I notice that the seller ended the auction early. Does anyone know what happened ?

Hi everyone! Here's the explanation of the problem:

I built my own PROSYS cable a long while back that used a MAX232 and a 9v battery as a power supply. I used this cable, an Indus drive and Steve Tucker's PROSYS for a long time quite successfully. I saw on a web site (Clarence Dyson's I think) that there was a design that used a 1489, didn't need the 9v battery and was considerably less complicated. I quickly built this and used it. I must have made ten or fifteen images and them my Indus stopped working. The PROSYS program couldn't sync with it and if I tried to boot from the drive on my 800XL, it would just slowly beep and display "BOOT ERROR" (the drive was useless after that). I figured the drive was old and it just died. I acquired a 1050 drive off eBay, checked that it worked on my Atari first, and then used that to make some images. After a few images, it too displayed the same symptoms and no longer worked.

Okay, I figured I screwed up my new cable somehow (I had taken apart the old one since I needed the SIO cable for the new one). Rich Cortes was then kind enough to donate a cable to me and I acquired another working 1050.

I received Rich's cable and started creating images again. Lo and behold, after a few images, the new 1050 died in the same manner as the other two drives. So, I'm guessing it might be something with the design and not my cable after all. I'm just really curious if anyone has seen or heard of this happening. What might cause something like this? If anyone have any ideas or are interested in this matter in any way, please let me know.

Curt
I've seen several 1450XLs, 4 I think. There just about isn't any such thing as a cosmetically perfect one in the ones I have seen. 3 of the ones I saw were at the Atari wharehouse sale, they were kind of pieced together with what looked like "First one out of the injection molder" plastic. Not that it made any diff, kind of obvious they were prototypes which made them have that certain esoteric value a lot of us appreciate. I think one even had a clear plastic riser for the drive compartment mated to the base. Like they cut the top off a 1400XL, put a ~rectangular clear plastic tube on top, and capped it with the cut off top of the 1400XL.

Which is what I hate about the PSX. All games look the same.

> FWIW, I bought a Jag & Saturn and watched them both die whereas my friends

> Considering the hardware, Driver is very impressive on the PSX.

You get to play excellent RPG's though, like Shining Force III and Panzer
Dragoon Saga, they play shitty Final Fantasy

That's because, in both cases, it was in their legal interests to do
so. Perfectly legit.

>XL..

But the 800XL is very expandable, mine is up to 256K.
My 130XE is 256 + 64K. Sadly theyve been in their boxes in the loft for
some while now, i must dig them out one day and find them some new homes.

Iam so sure, will put money on the it.
Sounds a lot like your heads in all drives are dirty. That will happen
with old disks. When I was archiving mine, I had to constantly clean
the drive head.
Some disks where quite bad for this. Some disks, I had to put in
several drives to get all the sectors read in properly. very time
consuming.

13.4) What are the pinouts for the...?
13.5) What BBS software can be used on the Atari?
13.6) What versions of Atari BASIC or the CTIA/GTIA chip do I have?
13.7) Which versions of the Operating System (OS) are there?
13.8) What games support 4 simultaneous players on the 400/800?
13.9) Why should I disconnect the 810/1050 power supply before connecting or
disconnecting SIO cables?
13.10) What is Omnimon?
13.11) What is the difference between NTSC and PAL machines?
13.12) Is the software for the Atari 8-bit computers "TV-standard dependent?"
13.13) What programming languages are available for the Atari?
13.14) What is the Atari XEP80 Interface Module?
13.15) What makes some XL/XE software incompatible with the 400/800?
13.16) What games run only on the 400 and 800 models?
13.17) What games make use of the Light Gun?
13.18) How do I type a tilde (common character in Web URL's) on my Atari?
13.19) What's the difference between ASCII and ATASCII?
13.20) What are the PAL, NTSC and SECAM video broadcast standards?

Other FAQ Lists for the 8-bit Atari
14.1) What vendors, developers, or publishers support the 8-bit Atari?
14.2) Where is my nearest 8-bit Atari BBS?
14.4) I'm new to the Atari. How do I use this thing?
14.5) Can I use an emulator to run my old Atari software on my new computer?

14.6) What hardware upgrades, modifications and add-ons are available?
14.7) What is the HARD-Interlacing-Picture (HIP) format?
14.8) How do I access Usenet, FTP, Gopher, and WWW by e-mail?

Reader-suggested topics, unwritten as yet: (volunteers?!)
How fast of a modem can my Atari display keep up with?
-with UltraSpeed roms?
-with XEP-80
-with any particular terminal program

What is APE?

Subject: 1.1) What is an Atari 8-bit computer?

400 800 1200XL 600XL 800XL 65XE 130XE 800XE XE Game System

Here is a very condensed history of Atari, centered around their 8-bit computers.

1972
Atari Inc. is formed by Nolan Bushnell, incorporated on Tuesday, June 27. Atari created the first coin-operated arcade video game with the introduction of Pong. The video game industry was launched and has shaped pop culture ever since.

1976
Warner Communications acquires Atari Inc.

1977
Atari launches the Video Computer System (VCS), later known as the 2600, giving birth to home video game systems.

1978
In December, Atari announces the Atari 400 and 800 personal computers, using the 6502 microprocessor. The Atari 800 was code-named "Colleen"; the 400, "Candy."

The following are most of the team who originally designed the 400/800.
Credit for providing this information for the FAQ goes to:
Doug Neubauer (by way of James Finnegan, mailto:finneganj@delphi.com)
Jerry Jessop, mailto:jjessop@ix3.ix.netcom.com
Scott Emmons, mailto:scotte@center.uscs.com

VLSI HARDWARE:
Jay Miner - Creator and System architect, VSLI manager
Steve Mayer - Also one of the creators - Partner in "Cyan Engineering"
Lawrence D. Emmons - Also one of the creators - Partner in "Cyan Engineering"
Joe Decuir - ANTIC and system and creator
???A French guy - ANTIC logic designer
George McLeod - CTIA and GTIA logic design
Doug Neubauer - POKEY logic design
Mark Shieu - POKEY chip design

Steve Stone - POKEY layout design
Steve Smith - Technician for ANTIC and GTIA
Delwin Pearson - Technician for POKEY

OS PROGRAMMERS:
Larry Kaplan
David Crane
Bob Whitehead
Al Miller

1979
The Atari 400 and Atari 800 Home Computers debut at the Winter Consumer Electronics Show (CES) in early January.

Jerry Jessop, mailto:jjessop1@home.com writes:
"The first official small shipment of the 400/800 was on August 29th 1979. These were hand built pilot run units to Sears that needed to be in stock by Sept. 1 so they could be placed in the big fall catalog. The units were placed in the Sears warehouse and then immediatly returned to Atari after the "in stock" requirment had been meet.

The first "real" consumer units were shipped in Nov. of 79 and were 400's to Sears followed very shortly by 800's."

These MOS Technology 6502-based systems run at a clock speed of 1.79 MHz, offering 128 colors displayable simultaneously, up to 320x192 graphics resolution and up to 40x24 text resolution in 8 graphics modes and 6 text modes. Video may be displayed either on a composite video monitor in the case of the 800, or on a standard television for both systems. 4 independent sound voices are available through the audio output of the television or monitor, each with a 3 1/2 octave range, plus there is a built-in speaker for key-click and other programmable sounds. The 800 has a second cartridge port and a full-stroke keyboard, while the 400 has a single cartridge port and a membrane keyboard. Each has 4 serial controller ports and an Atari Serial Input/Output port. Originally, both the 400 and 800 were sold with 8K RAM, but later most 800's were sold with 48K and 400's with 16K. Each includes the 10K Atari Operating System in ROM.

The 800 can be fitted with 1-3 of the following two RAM modules:
CX852 8K RAM module, CX853 16K RAM module
and must be fitted with a ROM module:
CX801 10K ROM, CX801-P 10K ROM for PAL machines

[WHEN WAS THE 400/800 REVISION B OS INTRODUCED????]

1981
November: 400/800's begin shipping with the new GTIA chip in place of CTIA, increasing the palette of simultaneously displayable colors to 256 and adding 3 new graphics modes. CTIA is totally phased out by the end of the year.

Jerry Jessop, mailto:jjessop1@home.com adds:
"The very first proto systems did have the GTIA, but it had some problems and was not released in the consumer version until 1981. The

GTIA was completed before the CTIA."

1982
The introduction of the 1200XL in late 1982 marks the single largest advance in the 8-bit Atari system. The 1200XL runs most software and hardware designed for the 800 and 400, but now runs a slightly more advanced 6502C microprocessor, and includes a full 64K RAM. The single cartridge and monitor ports remain, along with 2 controller ports. In addition, the 1200XL includes 4 programmable Function keys and a Help key, built-in diagnostic and graphics demonstration programs, and probably the favorite keyboard of any 8-bit Atari computer. Clicks previously outputted through the built-in speaker are now heard from the television or monitor's speaker. The revised 16K Operating System offers many new features, including an alternate International Character Set.

1983
In 1983 Atari replaced the 1200XL/800/400 line-up with the new 800XL and 600XL. These new machines include most of the features of the 1200XL minus the Function keys and the demo program. But now both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Buss Interface (PBI), providing fast parallel access to the heart of the computer. The 800XL contains 64K RAM while the 600XL has 16K RAM.

The 600XL can be expanded from 16K to 64K with the 1064 Atari Memory Module.

1984
Warner Communications sells Consumer Electronics and Home Computer divisions of Atari Inc. to Tramiel Technologies on Monday, July 2.

Atari Corporation is formed by Tramiel Technologies and its products marketed under the Atari brand.

(
Atari Games Corporation is also formed from the former coin-op division and markets coin-op games under the Atari Games brand.

Atari Games Corporation is a developer, marketer, licensor and publisher of coin-operated video games, having created such classics as Pong, Asteroids, Centipede, Missile Command, Gauntlet, Area 51, and San Francisco Rush Extreme Racing. Atari Games Corporation is a subsidiary of Midway Games Inc. (NYSE:MWY). The Atari Games home page is at http://www.atarigames.com.
)

1985
The new Atari Corp. delivered on its promise to advance the 8-bit Atari system by replacing the 800XL/600XL with the new 130XE and 65XE in 1985. The 65XE is nearly identical to the 800XL in features, minus the PBI. The 130XE, however, offers 128K RAM, plus the FREDDY chip, supporting the unique (but rarely used) ability for the 6502C and the ANTIC to independently access RAM banks. In addition, the 130XE replaces the PBI port with the Enhanced Cartridge Interface (ECI), continuing the powerful feature of a fast parallel port. European 65XE's include the ECI port.

Only by the final production run of the 130XE (when was this???) was the XL/XE OS revised to include a "keyboard test mode" that matched the XE keyboard, and a RAM test that tests the full 128K of RAM.

1987
In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system. It offers the convenience of a detachable keyboard and built-in Missile Command game (hold down Select at startup), while offering 64K RAM and full compatibility with the 65XE.

The 800XE, a 130XE with just 64K, was released at some point in eastern Europe. [WHEN???]

1992
Atari officially dropped all remaining support of their 8-bit computer line on January 1, 1992.

1996
On July 31, 1996, Atari Corp. became a JTS subsidiary. JTS Corp., with headquarters in San Jose, Calif., was founded in 1994 to design, manufacture and supply enhanced-capacity hard disk drives for the notebook and desktop personal computer markets.

1998
On February 23, 1998, JTS sold its Atari Division to HIACXI Corp., a wholly-owned subsidiary of Hasbro Interactive, Inc., which is a subsidiary of Hasbro, Inc., for $5 million in cash.

1999
Hasbro is a worldwide leader in the design, manufacture and marketing of toys, games, interactive software, puzzles and infant products. Both internationally and in the U.S., its Playskool, Kenner, Tonka, OddzOn, Super Soaker, Milton Bradley, Parker Brothers, Tiger, Galoob and Hasbro Interactive products, provide children and families with the highest quality and most recognizable toys and games in the world.

Hasbro Interactive, Inc. is a leading all-family interactive games publisher, formed in 1995 to bring to life on the computer the deep library of toy and board games of parent company, Hasbro, Inc. Hasbro Interactive has expanded its charter to include original and licensed games for the PC, the PlayStation and Nintendo 64 game consoles and for multi-player gaming over the Internet. Headquartered in Beverly, Massachusetts, Hasbro Interactive has offices in the U.K., France, Germany, Japan and Canada. For additional information, visit Hasbro Interactive's web site at: http://www.hasbro-interactive.com .

Atari Interactive, Inc. is a Hasbro affiliate, online at http://www.atari.com/

Atari currently (12/99) markets:
Atari Arcade
Centipede
Frogger
Glover

H.E.D.Z. - Head Extreme Destruction Zone
Missle Command
Nerf ArenaBlast
The Next Tetris
Pong
Q*Bert

Subject: 1.2) What can I do with an 8-bit Atari?

What can you do with an 8-bit Atari computer system? Virtually anything you can do with any other type of computer!

Programming? Pascal, C, BASIC, Logo, Pilot, Forth, Lisp, 6502 assembler... Plus powerful unique languages like Action! and QUICK...

Word Processing? Try AtariWriter, Letter Perfect, Paperclip, TextPro, Bank Street Writer, 1st EXLent, TurboWord, Cut & Paste, Letter Wizard, Panther, Superscript...

Database? Try TurboBase, TurboFile, Synfile, Data Perfect, MicroFiler, MegaFiler, Homebase, Super Data Base 1-2-3, Small Business System...

Speadsheet? Look at Syncalc, Visicalc, TurboBase, Calc Magic, Turbo-Calc, SAM Budget...

Communications? There's Express!, BobTerm, Kermit-65, Omnicom, VT850, Chameleon, Ice-T, FlickerTerm 80, Term80...

Graphics? Print Shop, Newsroom, Blazing Paddles, Video Title Shop, Virtuoso, Movie Maker, News Station, Publishing Pro, Awardware, Page Designer, ChromaCAD, Rambrandt...

Music? Virtuoso, Music Studio, Music Construction Set, Songwriter, Electronic Drummer, Music Painter, Music Composer, AtariMusic, MIDI-Track, Digital Music System, Chaos Music Composer... The ATARI 8-bit could also be made to speak using SAM (Software Automated Mouth) by Don't Ask Software. It can speak without the use of any hardware modification.

Alternate Operating Systems? There's the Diamond Graphic Operating System; SpartaDOS X, the 64K DOS on a "supercartridge"; the S.A.M. (Screen Aided Management) 80 column Desktop System; the Ultra Speed Plus OS; the TurBoss! High Speed O/S...

Hardware? A plethora of upgrades and add-ons are available, realizing improvements in speed, memory, sound, graphics, storage media...you name it!

Education? Colorful graphics, exciting sounds and full-screen editing give rise to hundreds of quality educational software titles.

Entertainment? The 8-bit Atari has long been famous for thousands of great games.

If you want to do something with a computer, chances are you can do it on an 8-bit Atari computer. While slower than today's PC's, the 8-bit Atari is far less costly than any of these, is easier to program at the machine level or alter at the hardware level, and has been documented more thoroughly than any of the newer computing platforms. The relative simplicity in design of the 8-bit Atari also means that many people find the systems more reliable than their modern counterparts.

The software for the 8-bit Atari is sometimes more powerful than on any other platform. For example, some Bulliten Board Systems are still run on 8-bit Ataris specifically because the BBS software available can be better than that for any other type of computer. There is a reason for the relative quality of software on the 8-bit Atari. People program commercially for the latest PC's to make money; people program the 8-bit Atari because they want to -- they enjoy producing good software. It takes a team of specialized programmers to develop a major piece of software for those other systems; with the 8-bit Atari, a single person has the chance to learn the entire system, thereby developing greater pride in his programming abilities and his final product. The character of the programmer can shine through.

The 8-bit Atari owner can take pride that his/her computer platform was developed years before the IBM PC or Apple Macintosh were even on the drawing boards, but remains as useful today as it was in 1979.

For these reasons and more, the 8-bit Atari remains a popular alternative in today's home computer marketplace.

Subject: 1.3) What are the some of the performance features of the 8-bit Atari?

Some of this text by mailto:bill@newbreedsoftware.com (Bill Kendrick).

CLOCK SPEED:
NTSC machines: 1.7897725 MHz
PAL machines: 1.773447 MHz

SCREEN REFRESH RATE:
59.94 times per second (Hz) on NTSC Ataris
49.86 Hz on PAL machines

ANTIC AND THE DISPLAY LIST:

ANTIC Mode #	CIO/BASIC Graphics #	Display Type	Resolution (full screen)	Number of Colors
2	0	Char	40 x 24	1 *
3	-	Char	40 x 19	1 *
4	12	++ Char	40 x 24	5
5	13	++ Char	40 x 12	5
6	1	Char	20 x 24	5
7	2	Char	20 x 12	5
8	3	Map	40 x 24	4
9	4	Map	80 x 48	2
A	5	Map	80 x 48	4

```
B 6 Map 160 x 96 2
C 14 ++ Map 160 x 192 2
D 7 Map 160 x 96 4
E 15 ++ Map 160 x 192 4
F 8 Map 320 x 192 1 *
F 9 + Map 80 x 192 1 **
F 10 + Map 80 x 192 9
F 11 + Map 80 x 192 16 ***
* 1 Hue; 2 Luminances
** 1 Hue; 16 Luminances
*** 16 Hues; 1 Luminance
+ require the GTIA chip. 1979-1981 400/800's shipped with CTIA
++ Not available via the BASIC GRAPHICS command in 400/800's.
```

GRAPHICS INDIRECTION (COLOR REGISTERS AND CHARACTER SETS):
Nine color registers are available. Each color register holds any of 16 luminances x 16 hues = 256 colors. (Four registers are for player-missile graphics.

Character sets of 128 8x8 characters, each with a normal and an inverse video incarnation, are totally redefinable.

PLAYER-MISSLE GRAPHICS:
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available. A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection.

DISPLAY LIST INTERRUPTS (DLI's):
Screen modes can be mixed (by lines) down the screen using the Display List - a program which is executed by the ANTIC graphics chip every screen refresh:

All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via DLI's.

SCROLLING:
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.

SOUND:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution, 8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.

A fifth "voice" is produced by the internal speaker on Atari 400/800's (for keyclick and buzzer) and in the XL's and XE's this was (fortunately!) rerouted through the normal audio output, and the keyclick can be disabled.

Subject: 1.4) What is the internal layout of the 8-bit Atari?

The following four paragraphs were written by Chris Crawford and appear in De Re Atari (Atari#APX-90008), a book published and copyright by Atari, Inc., 1981-1982. The text been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different from other systems. It of course has a microprocessor (a 6502), RAM, ROM, and a (PIA). However, it also has three special-purpose (LSI) chips known as ANTIC, GTIA, and POKEY. These chips were designed by Atari engineers primarily to take much of the burden of housekeeping off of the 6502, thereby freeing the 6502 to concentrate on computations. While they were at it, they designed a great deal of power into these chips. Each of these chips is almost as big (in terms of silicon area) as a 6502, so the three of them together provide a tremendous amount of power. Mastering the Atari 8-bit computers is primarily a matter of mastering these three chips.

ANTIC ("Alpha-Numeric Television Interface Circuit") is a microprocessor dedicated to the television display. It is a true microprocessor; it has an instruction set, a program (called the display list), and data. The display list and the display data are written into RAM by the 6502. ANTIC retrieves this information from RAM using direct memory access (DMA). It processes the higher level instructions in the display list and translates these instructions into a real-time stream of simple instructions to GTIA.

CTIA ("Color Television Interface Adapter") / GTIA ("George's Television Interface Adapter") is a television interface chip. ANTIC directly controls most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missle graphics, and collision detection.

POKEY (means "POT and KEY" as in the paddles and keyboard) is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

While the 400/800 models contain a generic 6502 CPU, all of the XL/XE models contain Atari's customized 6502C chip. Alan Manuel K. Gloria, mailto:mani@pworld.net.ph writes:

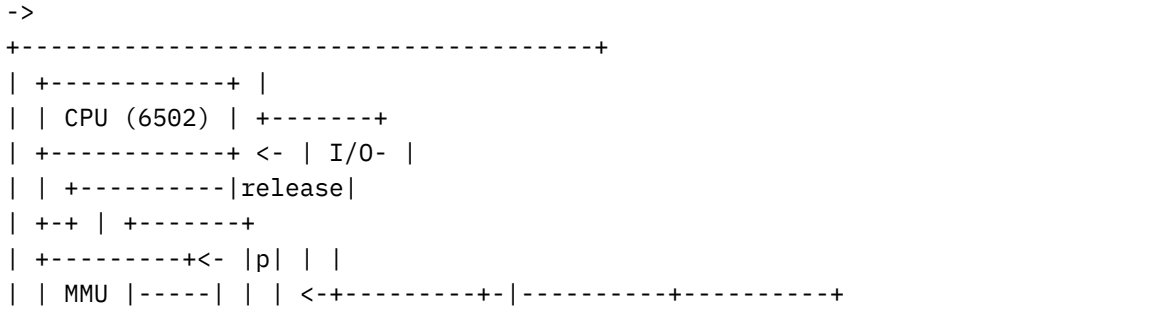
The difference goes something like this: On the Atari, there are two microprocessors, ANTIC and the 6502 or 6502c. To allow them to coexist, ANTIC must shut off the 6502/6502c, a process called DMA. The 6502 supports DMA, but in Atari's implementation, it required 4 chips. The 6502c has this additional circuitry built-in.

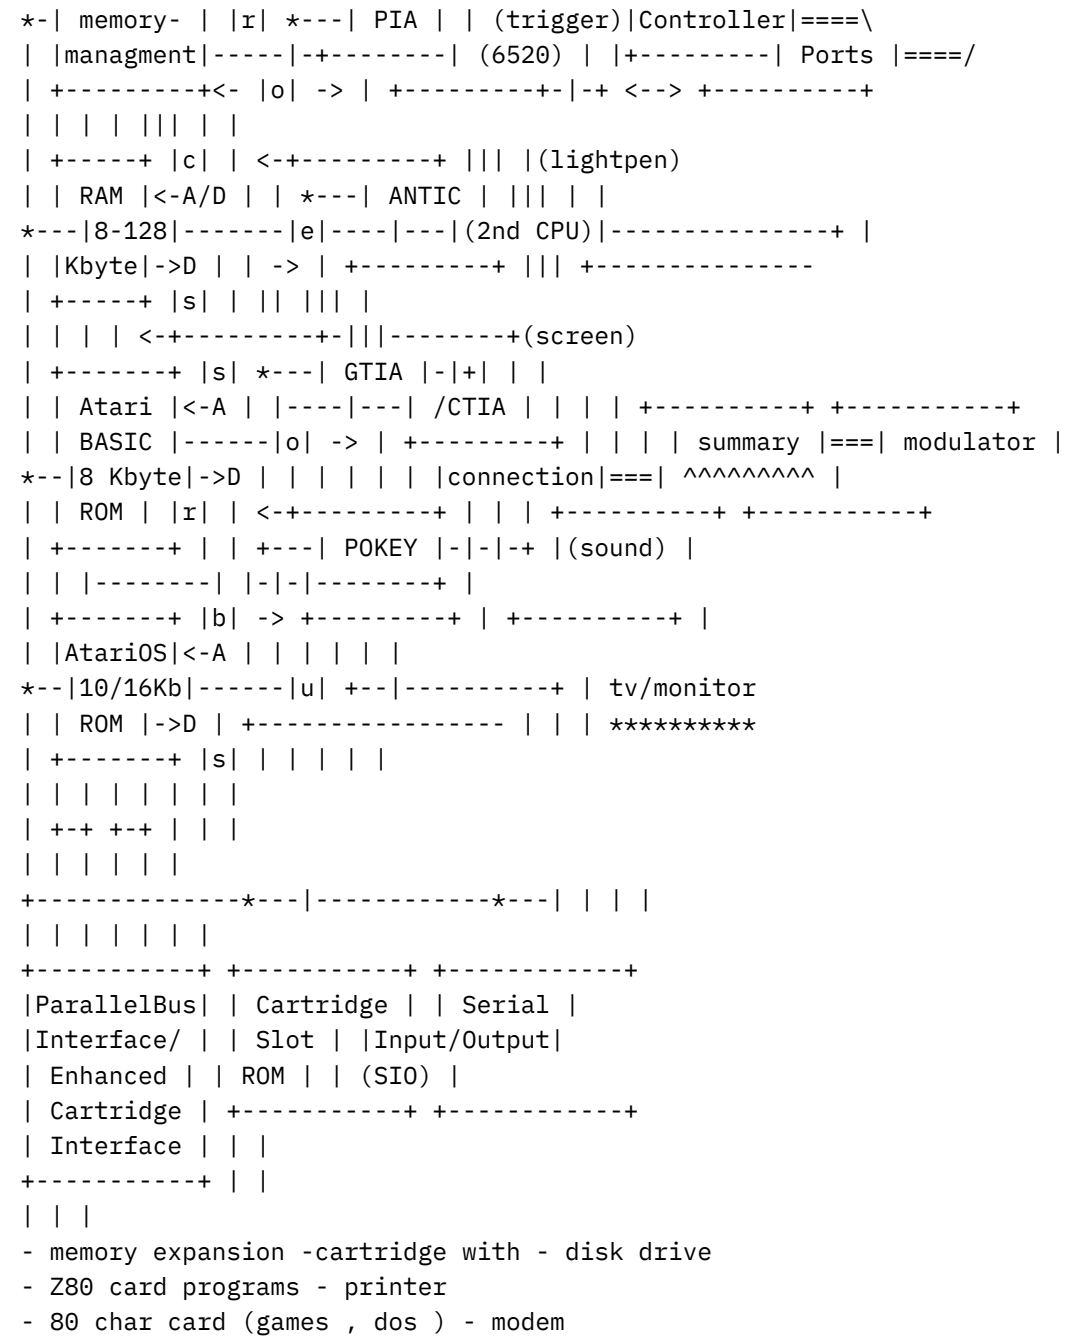
More on this from James Bradford, mailto:sup8pdct@mail.cth.com.au :
The 6502c in all PAL atari's, late 400/800, XL, XE NTSC atari's have a special 6502. This 6502 has an extra line called HALT. It is controlled by ANTIC which it uses whenever it needs the data/address bus. The HALT line is on pin 35 of the atari 6502 and must be pulled high for the chip to work (I think) . Early 400/800 NTSC atari's used a standard 6502 and a couple of chips to stop the processor when antic needed the busses

The 130XE and XEGS contain a small additional LSI called FREDDY, a RAM address multiplexer. According to mailto:sup8pdct@mail.cth.com.au (James Bradford), "FREDDY is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. FREDDY also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a FREDDY but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from FREDDY, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to FREDDY for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say FREDDY does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO FREDDY) and an extra 8 RAM chips."

And more recently James Bradford has written:
Freddy is just a memory decoder and timer. It replaces several chips in the 800xl The small chip near freddy does all the bank selection. CO25953. One line from freddy , Ras (or is it cas?) goes to this chip, Halt and the bank /processor select lines go into this same chip and ras (cas?) comes out. a pin for each bank. If i remember correctly, refresh also goes into this small chip. It would be quite easy to make an 800xl work just like a 130xe with this chip since Ras (Cas?) is required by ALL dynamic ram.

Hardware Arrangement (With thanks to mailto:twh@bigfoot.de (Thomas Havemeister))





- memory expansion -cartridge with - disk drive
- Z80 card programs - printer
- 80 char card (games , dos) - modem

NOTES
* RAM: 400/800: 8K, 16K or 48K standard
600XL:16K standard
1200XL/800XL/65XE/800XE/XEGS: 64K standard
130XE:128K standard
* ROM: 400/800:10K OS, 1200XL:16K OS, all others:16K OS + 8K Atari BASIC
* CPU: 400/800:6502, all others:6502C
* 800 includes two Cartridge Slots, all others include one
* early release 400/800 have CTIA instead of GTIA
* 400/800 have 4 Controller Ports, all others have 2
* PBI is on 600XL/800XL only

* ECI is on 130XE/800XE only

Technical data and schematics for the Antic, GTIA, and POKEY chips are available on Curt Vendel's web site, thanks to permission from Hasbro's Atari Interactive Divisions release of this data. See: http://www.atari-history.com/articles.html

---

Subject: 1.5) How did Atari get it's name?

Graham Thornton, mailto:dangermouse@prodigy.nospam.net types:

This article was published in "I/O - The Magazine of the Atari Home Computer Club" in issue 3 - Summer 1983. The magazine was the official mouthpiece of Atari UK. The article was not attributed to any one person. The words are thiers, not mine.

How Atari Got It's Name

The name Atari actually comes from Japan. And yet the company is most definitely American. Every wondered why? It's an interesting story and one well worth telling.

In 1972 three friends decided to invent and market the first commercially feasible video game. They were Nolan Bushnell, Ted Dabney and Larry Bryan.

To become a partner each man had to submit $100 to the project - a remarkably small sum when you consider the company's success! The next step was to find a name.

Drinking beer and thumbing through the dictionary one day, the three friends came across an interesting entry under "S". The word was Syzygy, or "the straight-line configuration between three celestial bodies". What a perfect name they thought, for three such astronomically talented people!

Now they could get on with the business of inventing games. Their first, Computer Space, was produced and all seemed to be going well.

But then things started to get a little shaky. Larry Bryan decided not to ante up his $100 and pulled out, leaving Bushnell and Dabney to go it alone.

The set up a shop in Santa Clara, California, and incorporated the business. A little later they invented Pong(r).

Busnell and Dabney applied for the name Syzygy to the Office of the California Secretary of State, which regulates Californian corporations, but were told that they were too late. The name was already taken.

Following unsuccessful attempts to buy the rights to the name from the first Syzygy corporation, which appeared to be inactive, the friends' solicitor pressed them to think up an alternative.

This proved difficult. BD Inc and DB Inc were tested and then rejected in turn: the first bore too close a resemblance to Black & Decker, the second to Dunn and Bradstreet.

Inspiration occurred at last, once again in an informal atmosphere. Bushnell and Dabney were both keen players of Go, a Japanese strategy game, and their best brainstorming always occurred over a good game and a bottle of beer.

This time, they decided to make a list of several Go words to see if one of them would fly as the new corporate name.

First choice was "Sente", which means "the upper hand" - something that greatly appealed. Second and third choices were "Atari", which has a similar meaning to the English word "check", and "Hanne", an acknowledgement of an over-taking move.

Busnell and Dabney submitted the list once again to the Office of the Californian Secretary of State, which approved "Atari". The rest is history.

When the company name changed, Bushnell and Dabney decided to update the logo too. They incorporated the "S" from Syzygy and the "A" from Atari into the new design.

It was not until later, as the company became increasingly successful, that an advertising agency designed the slicker and now famous Atari logo - the "fuji" or stylised "A" design.

Subject: 2.1) What is comp.sys.atari.8bit?

news:comp.sys.atari.8bit is the unmoderated Usenet newsgroup for discussion about the Atari 8-bit family of computers, including the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE and the XE Game System!

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st.

Large binary posts do not belong in unmoderated discussion groups like comp.sys.atari.8bit. If you wish to share PD/freeware/shareware, use alt.binaries.atari and alt.binaries.atari.d or upload the software to the University of Michigan Atari Archive.

To the best of my knowledge, there is no charter for comp.sys.atari.8bit, presumably because the custom of drafting charters for new newsgroups did not exist at that time.

Subject: 2.2) What other Usenet newsgroups cover the 8-bit Atari?

news:comp.sys.atari.advocacy
Attacking and defending Atari computers. Unmoderated.

news:comp.sys.atari.announce
Announcements of Atari-related hardware and software, Web sites and other
Internet resources, and events
Moderated by Kevin Savetz, mailto:savetz@northcoast.com
Archived at http://www.savetz.com/csaa/

news:comp.sys.atari.programmer
Programming on the Atari computer. Unmoderated.

news:rec.games.video.classic
Orphan home video game systems. Unmoderated.

news:comp.emulators.misc
Emulating one kind of computer on another. Unmoderated.

news:comp.emulators.announce
Announcements related to computer emulators.
Moderated by Qualcomm, mailto:emulators-request@qualcomm.com

news:alt.binaries.atari
uuencoded software for Atari computers. Unmoderated.

news:alt.binaries.atari.d
Descriptions/discussions on software posted on alt.binaries.atari. Unmoderated.

news:alt.binaries.comp.atari8bit
uuencoded software just for the 8-bit Atari. Not widely available.

Subject: 3.3) What is ATARIPL?

From: Wojciech Hartman <harti@waw.pdi.net>
Date: Saturday, March 15, 1997 3:51 AM

I am proud to announce that there is a mailing list "ataripl" for all
polish-speaking Atari users and enthusiasts.

To subscribe the lists you have to send an email to
mailto:majordomo@piwo.bl.pg.gda.pl containing a line "subscribe ataripl".

Subject: 3.4) What is ATARI8-L?

maciej grzeszczuk, mailto:krap@zwieracz.ideefixe.nom.pl writes:

i'd like to invite all of you to atari8-l mailing list.

it's probably the biggest atari 8 bit related mailing list in the world -
- connected bidirectionally to old list at MARIST, and gatewayed to the
FidoNet(tm) international ATARI8-L echo.

for now it has about a 100 subscribers, from all around the world. the list
is free from all the F/S messages, and other off-topic discussions, so
you can find there pure atari8 related stuff... all the messages comes right
to your email account, so there is no need to contact a newsserver, there

is no old-messages deleting, and so on... my wish is that every atari user would be subscribed, so the atari community stay together and grow in strenght.

to subscribe, please send the message to majordomo@zwieracz.ideefixe.nom.pl with the following line in the body (not the subject) of your message:

subscribe atari8-l

the language we use is, of course, english. the list is fast, reliable, regularly maintained.

there is also mail2news gateway that translates all postings on the list to easy to read usenet articles, available read-only to everyone at: news://zwieracz.ideefixe.nom.pl/listserv.atari8-l

the atari8-l mailing list is available as well as a newsgroup listserv.atari8-l on public newsserver zwieracz.ideefixe.nom.pl .

there is also archive of all postings that appeared on the list (well, in fact almost all - about first hundred is missing).

(There's an old list called INFO-ATARI8 which is actually still alive. But knowing about it is no longer necessary, as 100% of its postings are cross-posted with atari8-l.)

Subject: 3.5) What is ATARI8PL-L?

any atari 8bit related threads are welcome. Polish language only.

to subscribe, please mail a message to mailto:majordomo@zwieracz.ideefixe.nom.pl

containing a line:

subscribe atari8pl-l <mailing address you'd like to receive the list to>

in the body (not the subject) of your message

if you get any problems, please report to maciej grzeszczuk, mailto:krap@zwieracz.ideefixe.nom.pl

---

Subject: 4.0) What is XL Search?

XL Search is a new and growing search engine created and maintained by mailto:bill@newbreedsoftware.com (Bill Kendrick), designed to provide much-improved access to the various PD/freeware/shareware Atari 8-bit software archives available on the Internet.

XL Search is located at: http://www.newbreedsoftware.com/xlsearch/

You can also access XL Search via e-mail! Send a blank e-mail to:
mailto:xlsearch@newbreedsoftware.com

XL Search now contains an index of 7 sites, totalling over 17,000 Atari
8-bit programs and files!

(By the way, the UMich site is also indexed at http://shareware.com/.)

Subject: 4.1) What is the University of Michigan Archive?

The University of Michigan (UMich) Software Archives hold a huge number of
files for many computing platforms, including the Atari 8-bit computers. For
more information:

Bill Kendrick, mailto:bill@newbreedsoftware.com (8-bit Atari files)
Mickey Boyd, mailto:boydm@atari.archive.umich.edu (the entire Atari Archive)
Michael Dautermann, mailto:myke@umich.edu (the entire UMich Software Archives)

Downloading

There are numerous methods available for downloading files from the UMich
Archive. The Archivists request you use these mechanisms in this order of
preference:

1) The number one way to get into the UMich archives is via AFS. If you have
AFS, all our files are kept in the directory
"/afs/umich.edu/group/itd/archive". If you have AFS, PLEASE USE IT!
Specifically, use:

file:///afs/umich.edu/group/itd/archive/atari/8bit/

2) Gophering to gopher.archive.umich.edu and looking under the "Software
Archives" choice. Specifically, use:

gopher://gopher.archive.umich.edu:7055/11/atari/8bit/

There are also mirror Gopher servers:
gopher://wuarchive.wustl.edu:70/11/systems/atari/umich.edu/8bit/
gopher://sunsite.doc.ic.ac.uk:70/1/0-Most-Packages/atari/umich/8bit/

3) The WWW interface is fine, at this point. http://www.umich.edu/~archive/
Specifically, use:

http://www.umich.edu/~archive/atari/8bit/

Mirror web sites:
http://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/
http://wuarchive.wustl.edu/systems/atari/umich.edu/8bit/

4) FTPing to atari.archive.umich.edu and looking in the "8bit" subdirectory.
Specifically, use:

ftp://atari.archive.umich.edu/atari/8bit/

The atari.archive.umich.edu FTP site is chronically overloaded, but there are
several mirror sites which are all updated from the home site regularly:
ftp://wuarchive.wustl.edu/systems/atari/umich.edu/8bit/
ftp://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/
ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit/
ftp://barnone.citi.umich.edu/atari/8bit/
ftp://ftp.kendall.mdcc.edu/pub/atari/umich.edu/8bit/
ftp://pmftp.cs.vu.nl/pub/atari8bit/

Brief FTP tips:
- user name is "anonymous"; password is your e-mail address
- Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

5) E-Mail <-> FTP gateways. See the section of this FAQ list entitled "How do
I access Usenet, FTP, Gopher, and WWW by e-mail?

Uploading

Bill writes:
If you're lucky enough to get into this archive via FTP, please upload
(with the appropriate translation ("ASCII" for text files, "BINARY"
otherwise)) your additions into the "New/" directory.

If you can only access this archive via Gopher, the Web or some other
uni-directional way, please e-mail additions to:

mailto:bill@newbreedsoftware.com

Please encode your files with UUencode or MIME ("base 64").

Always remember to upload a ".blurb" file to describe what you've
uploaded. And if there's a specific place you think the file should
go, please mention it in the ".blurb" and/or in an e-mail to me.

Please keep your ".blurbs" short, however. (1/2K or less!)
If you have text documents for the program, include them in an ARC file
with the program, or send them seperately as a ".TXT" file.

Thanks!

Subject: 4.3) What is the PVV Archive?

This is a mid-sized Atari FTP site maintained by mailto:eyvind@stud.unit.no
(Eyvind Bernhardsen). PVV stands for ProgramVareVerstedet, or The Software
Workshop, a student society at the University of Trondheim, Norway.

ftp://ftp.pvv.unit.no/pub/atari/8bit/ (129.241.210.232)

Uploads go to /incoming/atari/8bit; Eyvind will move them to the appropriate
directory. Please include a readme file with each upload, so people know
what they're downloading.

Subject: 4.4) What is the ClarkNet Archive?

A mirror of Kevin Atkinson;s ClarkNet Archive, kept by Jason Duerstock:
ftp://ftp.kendall.mdcc.edu/pub/atari/clark.net/ (147.70.146.36)

Subject: 4.5) What is the Gatekeeper's Archive?

This small FTP site offers most of the resources provided on the Atari
8-Bit Home Page. Kept by mailto:ipoorten@cs.vu.nl (Ivo van Poorten, The
Gatekeeper).

ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit (192.31.231.43)

Subject: 4.6) What is the Polish Demo Archive?

It's a place when you can get all Polish (not only) demos (not only)
on a Atari 8-bit.
If You have any comments, write to:
mailto:LukSoft@hipokrates.am.lublin.pl

ftp://hipokrates.am.lublin.pl/sys/pub/atari8/

Subject: 4.7) What is the Atari 8bit FTP Archive in Slovakia?

This FTP site contains demos, games, utilities, zines and other useful stuff
from all the world. Also, you can download big amount of slovak and czech
programs for 8bit Atari only from this archive. And finally, because this
site is created and supported by slovak computer group GMG, most of our
products can be found right here.

If you want to place here your program, just send it to me (with some
comment) by e-mail and I will do the rest.

If you have some problems or questions, please contact me at this address:

mailto:mchorvat@econ.umb.sk (Marek Augustin Chorvat)

ftp://svs.scsss.sk/pub/atari

Subject: 5.1) What is the National Capital FreeNet Atari Users SIG?

Internet access to the National Capital FreeNet (Ottawa, Ontario, Canada):

telnet://telnet.ncf.carleton.ca (Type "go atari" at any menu) or
gopher://gopher.ncf.carleton.ca or
http://www.ncf.carleton.ca/

Contact:
mailto:ac382@freenet.carleton.ca (Jack Kitowicz) or
mailto:aa728@freenet.carleton.ca (Blair Dea)

Subject: 5.2) What is the Victoria Telecommunity Network Atari Users SIG?

Internet access to the Victoria Telecommunity Network (Victoria, British Columbia, Canada):

telnet://freenet.victoria.bc.ca (Type "go atari" at any menu)

Contact:
mailto:ua558@freenet.victoria.bc.ca (Gordon Hooper) or
mailto:ud264@freenet.victoria.bc.ca (Ted Skrecky)

Subject: 6.1) What is FidoNet?

[We're not quite sure of the source of the following two paragraphs, but they may have been orginally written by Alan Sharkis.]

FidoNet is a system not unlike the Internet in that it consists of BBSs linked together. Each discussion group (there are nearly a thousand) may or may not be carried by an individual BBS as the sysop chooses. Discussion groups are called echoes, and each echo must be moderated. There is an Atari National Echo which is 8-bit, and several (I believe) ST echoes. BBSs are also free to have local discussion groups that may or may not be echoed nationally.

To access FidoNet, you need to find a FidoNet BBS that carries the echo or echoes you wish to read, and then abide by the rules of both that BBS and the echo. Some of these BBSs require annual membership fees. Some are supported by voluntary donations. One such that can also be reached by telnet is Doc's Place BBS. I'm not even sure of its location, but I think it's Clearwater, FL. If you're coming in via an ordinary ISP and either Netscape or IE, you simply type:

telnet://bbs.docsplace.org

mailto:krap@zwieracz.ideefixe.nom.pl (maciej grzeszczuk) adds:

all fidonet backbone echoes are carried by zwieracz.ideefixe.nom.pl, and they are available read-only via any newsreader. zwieracz itself (2:480/70, 2:48/70, 2:48/700, 2:2/3009) is the main polish fidonet-internet gateway. i gateway many usenet groups onto fidonet echoamil bidirectionally, so fidonet users here in poland can easily read and post articles. this group is also available at my system via EMSI over TCP or standard modem dial-up connection (emsi over tcp ports are 60177 - for telnet, and 60179 for raw socket).

try url: news://zwieracz.ideefixe.nom.pl/fido.atari and you'll reach national ATARI group.

Subject: 7.1) What is the Atari 8-bit Computer Web Ring?

A WebRing is a set of web pages that have been linked to each other. Basically the first page in the ring has a link to the second one, the second one to the

third, the third to the fourth... with the last page linking back to the first. This is all done by adding a small piece of HTML code to your page, which will automatically keep track of where your page lies in the WebRing. In this way pages from all over the world dealing with similar subjects can be linked together. In our case the subject is Atari 8-bit computers, so all pages in this WebRing are about the Atari 8-bit.

The home page of the Atari 8-bit Computer Web Ring is at:

http://www.geocities.com/SiliconValley/Lakes/7953/a8ring.html

and the ring is maintained by Raphael Espino, mailto:rje@co.umist.ac.uk

---

Subject: 7.2) What WWW pages support the 8-bit Atari?

This should be a complete list of WWW pages supporting the 8-bit Atari.

VENDORS/DEVELOPERS/PUBLISHERS:
See my companion vendor/developer list

USER GROUPS:

Subject: 8.1) What IRC channels discuss the 8-bit Atari?

==> #atari8 - Just for 8-bit Atari users!

Paul Clark offers this tip:

I think Dalnet carries #atari8, do the following;

telnet://telnet.dal.net

At the login prompt, type;

dalnet

If prompted for a password, just hit enter. You should
be able to navigate to #atari8 from there.......

==> #rgvc - Classic Games and Systems Collectors. "Rec.Games.Video.Classic"

mailto:cmwagner@gate.net (Chad Wagner) writes:

If you have access to a Unix host then you should be able to get to irc by
typing irc at your shell prompt and jumping on an EFnet server
(irc.portal.com, irc.eskimo.com, dewey.cc.utexas.edu) and joining #atari8.

If you are using a host that has a menu system then locate IRC and go there,
and join #atari8 (and hope your on EFnet, :).

If you are using SLIP/PPP then download a client (for Windows users, download
mIRC for Winsock archives, and I would guess that most SLIP/PPP users -- if
they have gotten that far -- are familiar with IRC, :) and select one of
the servers and join #atari8. There is many IRC servers on EFnet, chances
are the one your on is on EFnet.

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
filenames: Archivers/uudecode.bas, Archivers/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
filename: Archivers/yau.arc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
filename: Utilities/uue.arc

Dumas UU-coder by John Dunning
filename: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The archives contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
filenames: Archivers/superarc.arc - both Super Un-Arc & Super Arc
Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc

Subject: 9.3) What are the .DCM, .ATR, and .XFD file formats?

These are all filename extensions used to name files containing entire 8-bit
Atari floppy disk images.

DCM - Disk Communicator format. Invented by Bob Puff,
mailto:audioguy@cheerful.com for his Disk Communicator 3.2 utility.
Used when working with native Atari hardware.

ATR - Atari disk image format. Invented by Nick Kennedy,
mailto:nkennedy@cswnet.com for his SIO2PC project.
Used when working with non-Atari hardware.

XFD - Xformer disk image format. Invented by Emulators Inc,
mailto:emulators@msn.com for their ST Xformer emulator.
Identical to ATR except without the 16 byte header.
Used when working with non-Atari hardware.

PRO - APE ProSystem format. Invented by Steven Tucker,
mailto:classics@nacs.net for his APE ProSystem device.
Used with APE, the Atari Peripheral Emulator.

Subject: 9.4) What are the .XMO and .BIN file formats?

XMO stands for XMODEM. The idea was that the file was not plain text,
but was a binary file. As a binary file, it had to be downloaded using a
file transfer protocol such as XMODEM. The use of ".xmo" as a filename
extender was popular once, but has been discouraged for years.

BIN - another filename extension sometimes used to designate binary-load
files. Like .xmo, use of .bin is discouraged.

Subject: 9.5) How can I make my commercial boot disk (tape, cart) into a load file or disk image?

Russ Gilbert, mailto:russg@en.com writes:

The disk image part is a matter of taking a copyable boot disk and making an atr, xfd, dcm or other disk image type file out of it, usually for use with an emulator. Before emulators, the Bob Puff .dcm format was used to store/archive/retrieve boot disk images.

Almost all commercial software for the A8 is/was copy protected. For boot disks, this usually involved a large number of special formatting that couldn't be copied using ordinary sector copiers. Usually the boot process involved checking to see if a certain sector error occurred, then proceeding. If the error did not occur, the disk was a copy and would not work.

For carts, usually the method of protection was to write to the cart area of memory and see if the value changed. If the value changed, the cart program was in RAM, not ROM and would fail to operate.

For tapes, again a fair number of schemes were used. Some varied the speed at which the tape loaded. I'm not familiar with tape protection schemes.

With all software media (cart, tape, disk), there may be program encryption, which must be decrypted before the program can run. This to make more difficult disassembly of the program.

There were/are a number of products to defeat copy protection/allow copying of protected software for the A8. The most common way to defeat copy protection was to disassemble the software and revise sections of code so that the copy protection was defeated. A software with defeated copy protection is called a 'cracked' software. The basic procedure is to understand how cart/tape/disk software initializes, loads and runs. Usually make a file out of the software and 'follow the code', starting with loading of the program, to decryption to the actual running of the program. Today, it is unnecessary to copy original commercial A8 software because it has already been defeated and may be found at a few ftp sites. (Note umich archive has no commercial/non-shareware software.)

Besides 'cracking' software, there were/are hardware devices to copy commercial protected software. The Happy 1050 and the Archiver, and probably other modifications to the 810, or 1050 allowed 'bit image' copying and reproduction of the special formatting that copy protected disks had. Using these archiving disk drives, a copy of the original disk,

including all special formatting and the original code is copied, thus making a copy protected copy, not cracked, just like the original.

For carts, copying could involve cracking or again there were/are products to reproduce the cart and simulate a ROM. Or the cart might be copied and burned on the correct type of eprom, to make a plug in cart. 'The Impersonator', the 'Pill' are two cart copy schemes copy the cart to a file, then don't change the code, but use a 'dummy cart' to fool the software into thinking there is a ROM present.

Basic tools for copying, then cracking, carts and disks are a sector editor and disassembler. Carts are usually most easily dumped using a special OS, like Omnimon, to interrupt the cart and dump memory to disk. There are a few pd cart copiers that have the user plug the cart in when the program is running, I don't believe these pd cart copiers are very good or very wise to use.

So, the basic answer to 'how do I make a copy of my copy protected commercial software' is don't bother. Find it on the net.

There is one exception, in that this 'solution' involves a minimum of effort and is relatively safe. I refer to 'Chipmunk' and 'Black Patch' software to make cracked boot disk copy of commercial disks. HOWEVER, even if you use these two commercial archival tools, be sure you write protect your originals, and be careful not to accidentally write to the original disk.

Finally, I'll mention a very modern (I mean 1997) product. The APE Pro system, by Steven Tucker, in the registered version of this shareware allows making disk images called 'Pro' images. APE (Atari Peripheral Emulator) requires a cable, called the SIO2PC cable, that connects the A8 13 pin serial port to a serial port on the IBM PC clone. To make 'Pro' images, a special adapter cable is needed, not just the 'standard' SIO2PC cable. The 'Pro' image can 'capture' the copy protection of an original commercial disk. The 'Pro' image can then be loaded into an A8 using the APE registered version software, thus backing up your original disk software. Note the 'Pro' image will only be of use to person(s) owning registered APE software and 'Pro' adapter cable.

Subject: 9.6) How can I convert my commercial boot tape into a cassette image file?

mailto:ernest@pi.net (Ernest R. Schreurs) writes:

For those of you that like ALL classic Atari software, there is now a
way to store all software that has been recorded on cassette tapes on
the hard disk of your PC. I have written a program that is similar to
the SIO2PC utility written by Nick Kennedy. But this one is intended
for use with cassette software. You will need the following items:

Any PC equipped with a sound card and about 50 to 100 Megs of free
disk space to work with. The sound card should be able to sample sound
at a sample rate of 44.100 Hz mono. The sample must be recorded into
a .wav file.
You need the wav2cas program to convert the .wav file to a .cas file.
The .cas file is a digital cassette image file that only contains the
data that is on the cassette tape. Once you have that, you can throw
away the .wav file. The .cas files are typically 16 to 64K, so they
are relatively small.

To load cassette files into your Atari (i.e. boot a digital cassette
image) you do not need a sound card. You do need a SIO2PC cable or
similar device. You also need the cas2sio program.

The wav2cas and cas2sio programs should be available from the archives
of Umich by now. They have been put together in one zip file
wav2cas.zip, along with the documentation and the 'C' source code.
You can download it through the web interface at the URL
http://www.umich.edu/~archive/atari/8bit/Emulators/Peripherals/wav2cas.zip
Note the capital in Emulators and in Peripherals.
Thanks to William Kendrick for helping me get it uploaded there!
You can also try the gopher stuff:
gopher://gopher.archive.umich.edu:7055/11/atari/8bit/Emulators/Peripherals/

Steven Tucker, the author of APE, has added support for this file
format as of version 1.15 of APE. It looks real neat, so try that out
too! Thanks to Steven for adding a nice user interface for these
cassette images. He did a nice job. I am hoping other using are
willing to write some programs to get more enjoyment out of this
underrated storage medium.

My stuff is available totally free for personal use, so I hope you
enjoy it. Read the docs about the conditions.

Keep those XL's/XE's humming.
If you have any questions feel free to E-mail me: mailto:ernest@pi.net

---

Subject: 11.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal
programs available.

Ice-T XE v2.72 (128K XL/XE) or Ice-T 800 v1.1 (48K)
shareware by Itay Chamiel, mailto:itayc@hotmail.com
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen

File Xfer: X/Y/ZMODEM download
Autodial: Yes (2.72) or No (1.1)
Backscroll buffer: Yes--8 screens (2.72) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.72) or No (1.1)
Summary: Outstanding flicker-free high-speed VT100 emulation.Recommended!
http://www.sitcom.co.il/users/itayc/

FlickerTerm 80 v.0.51, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus

BobTerm 1.22, shareware by Bob Puff
(There's also a 1.23 that's specific to PC XFormer)
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; best for BBSing
filename: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
filenames: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Only option combining VT100, XMODEM, Kermit; buggy at file Xfers
filename: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80

File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Only option for VT100 emulation on the XEP80; 1200bps top speed
filename: Telecomm/vt850b1.arc

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
filename: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
filename: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
filename: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett with Mark Vallevand, and
SpartaDOS disk utility by Mark Vallevand
filename: Diskutils/myutil.zip
includes best version of UTIL for read/write of SS/DD 180K Atari disks,
plus Mark's SpartaDOS disk utility v0.1e to access 180K SpartaDOS disks

MyUTIL and the XF551 - tips from mailto:JTKIRK@urp.edu.pe:

]MyUtil works fine with the XF551. The XF551's speed is 300 rpm (sometimes even
]up to 303 rpm). I've got two XF551s and can read/write disks written on a PC
]with MyUtil on both with no problems. MyUtil even can write to a DS/DD disk,
]for a total of 360 K, BUT: the ATARI disks not only have the bits inverted,
]the second side is also read BACKWARDS respect to PC disks. That is, when
]MyUtil on the PC writes to what it thinks is sector 721, it really is writing
]to sector 1440! Worse, if you take an ATARI disk with a file whose sectors
]get past sector 720, MyUtil will attempt to read the sector 2161-n instead of
]'n', and you'll get a 'truncated record' error. The solution is simply to
]rewrite the code to take into account this (if sec>720 then sec=2161-sec).
]Let me know if you modify this. You don't know how frustrating it is to have
]to use only 180 K of a 360 K disk! I'm going to analyze the source code, but
]I don't know if I will be able to modify it properly. If someone does it
]before, please email me and send me an uuencoded copy or tell me where to get
]it.

Here's some advice on using the above utilities from mailto:hans@umd5.umd.edu
(Hans Breitenlohner):

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (288 rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,
making that sector unreadable. (The next physical sector is usually
the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)
Konrad Kokoszkiewicz, mailto:draco@mi.com.pl answers:
"The XF551 disk drive is not slowed down - these drives are spinning
300 rotations per minute. To prevent troubles with read/write disks
formatted and written on normal Atari drives (288 rot/min), the main
crystal frequency for the floppy disk controller is 8.333 MHz
(not 8 MHz, as in 1050, for example)."

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width. The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on
either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC
for PC to Atari transfers.

Jon D. Melbo, mailto:ssilicon@lax.net sums it up this way:
So a basic rule of themb when sharing 360KB floppies among 360KB &
1.2MB drives is: Never do any writes with a 1.2MB drive to a disk that
has been previously written to in a 360KB drive....UNLESS... you only
plan on ever using that disk in the 1.2Mb drive from then on out. Of
course a disk can be reformated in a particular drive any time for use
in that drive. As long as you follow that rule, you can utilize the
backwards compatible 360KB modes that most 1.2MB drives offer.

While the above work with SS/DD 180K Atari-format disks, the following
combination of utilities can be used to work with SS/SD 90K Atari-format
disks, and is currently the best bet for reading SS/ED 128K Atari-format
disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
filenames: Xf2/anad207.zip, Xf2/anadisk.txt
Apparently 2.07 is buggy.
Anadisk 2.06 is available at: http://ch.twi.tudelft.nl/~sidney/atari/

Deana by Nate Monson - converts AnaDisk dump files from Atari format
filenames: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to mailto:crow@cs.dartmouth.edu (Preston Crow),
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 11.3) Can I read/write MS-DOS disks on an 8-bit Atari?

a) Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050
drive or equivalent. Very limited.
filenames: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

b) SIO2PC, described elsewhere in this FAQ List (section 11.5), can be
used to read/write to a hard drive connected to an MS-DOS system. This
can also be a very effective file-transfer solution.

c) The XF551 3.5" Upgrades from Computer Software Services (see the
companion vendor/developer list) allow the Atari XF551 disk drive to read
720K 3.5" MS-DOS disks.

d) The Floppy Board, the add-on to the Black-Box from Computer Software
Services (see the companion vendor/developer list), allows both low
density (360K 5.25", 720K 3.5"), and, in the case of the Deluxe
Version, high density (1.2M 5.25", 1.44M 3.5") external MS-DOS-standard
floppy drives to be used on the Atari. A utility is included to
read/write MS-DOS formatted floppies in all supported densities.

Subject: 11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (Russ Gilbert)

Q: How do I connect two cmputers using a null modem cable?

A: You need a term program and RS 232 ports on both
computers. The RS 232 ports need to be connected
together using a 'null modem cable'.

For up to 4800 baud, no flow control lines need be
connected. Just cross the transmit and receive lines
and join the grounds together. Transmit is pin #2,
receive is pin #3 and ground is pin #7 on the 25 pin
port. 25 pin #2 goes to Atari #4 (XMT to RCV), 25 pin
#3 goes to #3 on Atari (RCV to XMT) and #5 of 850 goes
to #7 of 25 pin (GND to GND).

The right hand pin on the 'long' side of a female 'D'
connector is #1. There are 13 holes on this 'long'

side, 12 holes on the 'short' side. The numbers go to the left 1 to 13 then #14 is under #1 and left again so that #25 is under #13.

Most term programs allow a null connection, without a carrier detect. Notably, 'Express 850' does not. I have only used 'Procomm 2.4.3' (the last shareware version of Procomm) on the PC and Bob Term on the Atari, but other term programs may work.

To check your null modem connection, start both PC and Atari term programs, set baud to 2400 or 4800 on both computers. No parity, 8 data bits, 1 stop bit on the PC. Be sure to use the correct COM port on the PC. Go to 'terminal' mode and you should now be able to type on either computer and see it on the other screen. To accomplish a file transfer, use Y-modem probably from Bob Term, rather than X-modem. X-modem will often append bytes to a file transfer, an undesirable event. There is also a very nice Z-modem recieve program for the Atari, called AtarZmodem by Larry Black for the Atari.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors (Radio Shack) some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modems and plugging in the null modem cable into the two modem cables. This also avoids the confusion of variations in the computer ports. Most computers connect into the modem end via a standard RS232 DB25 connection. With this both ends 25 pin cable, you would cross pins 2 and 3 and connect the #7s together to make a null modem cable.

The SIO port on the Atari cannot be used directly. An 850, P:R: connection, MIO, Black Box or similar device that provides an RS232 port must be used.

Following are pin assignments for a DB25 pin RS 232 C port.
1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

For higher speed connections, above 4800 or 9600, you need the flow control lines and Atari term software that has flow control built in. You also need an MIO or Black

Box, which uses the PBI (parallel bus). A high speed cable would need not only XMT, RCV, and GND, but also flow control lines. I suggest a commercial null modem from computer store to ensure correct lines. A null modem is a small adapter with the correct lines already crossed. I don't know how to correctly connect the CTS, RTS, DTR, DSR, CRX lines for a high speed null modem. With a null modem, you just plug it into the 25 pin connectors of the two modem cables you might already have connected to your Atari and PC or Mac. You may need a straight thru 25 pin gender changer also.

Following is in this FAQ elsewhere, but I summarize here: (Figure out or look for pin numbers on the ports.) Note that these are pin assignments, and NOT null modem connections with the XMT, RCV crossed and GND straight thru.

```
Atari 8-bit PC AT 25 PC AT 9 pin
------------------------------------
1. DTR 20 4*
2. CRX 8 1*
3. XMT 2 3
4. RCV 3 2*
5. GND 7 5
6. DSR 6 6
7. RTS 4 7
8. CTS 5 8
9. No connect? shield RI
22 RI
```

Note: * above indicates the difference between an AT 9 pin and a Atari 8-bit 9 pin cable connector. eg. If you check continuity from pin 3 of 25 pin end and it goes to pin 4 of nine pin end, you have an Atari serial cable. If pin 3 of 25 pin goes to pin 2 of 9 pin end, you have a PC serial cable.
(updated 3/1/99)
(DTE = Data Terminal Equipment ie. your computer.
DCE = Data Communications Equipment ie. your modem.)

Subject: 11.5) What is SIO2PC?

From the SIO2PC home page, written by Nick Kennedy:

SIO2PC is a hardware & software package interfacing the 8-bit Atari to PC compatible computers.

The original idea was to have the PC emulate Atari disk drives so Atari programs could be stored on the PC's hard (or floppy) drives. It turned out to be quite successful. About 95% of my work was in the software, but a hardware

device to convert logic levels was also necessary. This device is now commonly referred to as an SIO2PC cable.

Features:

Emulates 1 to 4 Atari disk drives

Store your Atari files on PC hard or floppy drives

Boot from the PC, real drive not needed to start-up

No software or drivers required for the Atari;
no conflicts: use your favorite DOS

Twice as fast as an Atari 810 drive and more reliable

Co-exists with real drives in the Atari daisy chain

Compatible down to the hardware level: use sector copiers, etc.

Print-Thru captures Atari print-out and routes to PC's printer

Convert Atari files to PC files and vice versa

1050-2-PC version connects PC directly to Atari disk drive

Nick Kennedy
mailto:nkennedy@cswnet.com
http://www.cswnet.com/~nkennedy/

Another source for building SIO2PC cables is Clarence Dyson's page at
http://www.redshift.com/~cdyson/atari.html

SuperDOS 5.1, TurboDOS, DOS XE, and patched SpartaDOS 3.2. XF DS system now
considered "standard".

More data on the XF551 compiled by Marco Antonio Checa Funcke,
mailto:mcheca@li.urp.edu.pe :

Processor: 8040/8050AH at 8.3333MHz (docs say 18.33, but it's a mistake)
Disk controller: WD 1772 02-02 (I opened my drives and looked at the
complete code)
SIO data rate: normal: 19040bps (NTSC)/18866bps (PAL)
high speed: 38908bps(NTSC)/38553bps (PAL)
Rotaton rate: 300RPM
Power source: external power adapter, 9V AC, 31VA, 60Hz (NTSC)/50Hz (PAL)

Operating modes: Single Dual Double Density
Number of sides 1 1 2
Total tracks 40 40 80
Sectors per track 18 26 18
Bytes per sector 128 128 256
Total bytes 92160 133120 368640
Encoding method FM MFM MFM
Transfer rate 125000bps 250000bps 250000bps
Acces time: (maximum)
track to track 40ms 40ms 40ms

motor start 1000ms 1000ms 1000ms

And even more info, from Andreas Magenheimer:
There are two versions - one from Mitsumi and one from another creator .
The mitsumi Xf drive can read and write to a single/dual/double density backside of a 5,25" disk (side b) if it is already formatted. The other drive cannot read nor write nor format the backside because it always looks for the timing hole !! (If you insert a B-side of a disk without a timing hole, it does not stop spinning around...even if this disk is formatted) Therefore the other drive has a flop-mechanism and a sort of automatic-density detection (which is not supported by the OS !!). If you put in a disk, the drive motor starts, trying to read that disk...

For better understanding: a mitsumi drive may need a flop mechanism (so a disk "flops" out, when opening the switch), a density detection (to know the correct density - like a 1050 does !!) and a timing hole redirection (thus not needing a timing hole). The other drive would merely need a timing hole redirection. Both drives then should have a new OS that uses the capabilities to automatically detect the density...

==> CSS XF551
SS/DS SD/ED/DD K-Products US Doubler compatible. Updates drive to work better and faster. Also 3.5" upgrade available

==> Percom RFD4x-Sy
where: x=0 -> a single-sided drive
x=4 -> a double-sided drive
y=1 -> a single-drive unit
y=2 -> a dual-drive unit

SS SD/DD Slave

==> Indus GT
SS SD/ED/DD Synchromesh mode usable with SpartaDOS X and DOS XL only. 72k under SpartaDOS X, 37k bps under DOS XL.

==> Astra Double-D?
SS/DS SD/DD? standard /LEDs and such

==> Rana 1000
SS SD/ED/DD standard /LEDs and such can format disks on a
stand alone basis

==> TOMS 720
double head disk drive, 5.25", with mounted interface Centronics,
chips: CPU 8085, WD2797, PIA 8255 (for handle Centronics), 32 KB ROM, 8 KB RAM
ROM contains: OS of drive, MYDOS 4.50 and some utilities (copy, format, etc.)
ROM is seen by computer as drive D1: (if drive is open), and D3: (when drive
has number D1:) or D4: (when drive has number D2:). It makes possible load DOS
from ROMdisk during booting system.
Formats of disks:
- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB
- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB
- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB
Transmition modes:
- normal - 19200 bps
- Turbo - 70000 bps
- UltraSpeed - 70000 bps
Also tracks buffering.

==> AS SN-360
double head disk drive, 5.25", CPU 8051, controler WD2797
19200 bps
Available formats:
- SS/SD - (FM) single sided, single density - 90 KB
- SS/ED - (MFM) single sided, enhanced density - 130 KB
- SS/DD - (MFM) single sided, double density - 180 KB
- DS/DD - (MFM) double sided, double density - 360 KB

==> TOMS 710
(The newest polish disk drive and probably the best one)
Similar to TOMS 720, one more format:
- double sided, 80 tracks, IBM (720 KB)
Transmition modes:
- standard 19200 bps
- TOMS Turbo (loaded from ROMdisk if drive is open) - 67000 bps
- UltraSpeed (QMEG-OS, SpartaDOS) - 67000 bps
Also tracks buffering.
ROMdisk contain:
- MYDOS 4.50
- COPY
- INIT
- TURBO - turn on/off TOMS Turbo mode
- BASIC - turn on/off Atari Basic

- AUTORUN.SYS - ramdisk
- README
Also TOMS Navigator instead of DUP.SYS. It is program similar to Norton
Commander on PCs.
IBM-ST copier on additional disk.

==> LDW Super 2000
SS SD/ED/DD 19200 bps or 67000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA2001 "California Access"
SS SD/ED/DD 19200 bps or 38400 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA2002 "California Access"
SS/DS SD/ED/DD 19200 bps, 70000 with SpartaDOS
CPU 8040, ROM 4 KB, RAM 256 B

==> Floppy board various
Any standard very fast parallel
DOS-transparent. Requires Black Box. DS system configurable for
XF Percom or ATR style

==> HDI various
Any standard very fast SIO? European
Sysop Fox-1 writes:
The HDI drive is, like all other I mentioned, connected to the atari 8-bit
SIO-bus. It's a PCB on where you can connect up to 4 PC-mechanics, no matter
it's 360, 720, or 1440Kb, nor 3.5" or 5.25". It's (partial?) developed by
Erhard Puetz (aka Floppy-Doc, aka Sysop Atreju), but is not available anymore
due the lack of the hard-to-get high-speed floppy-controller.

==> SWP ATR-8000
Any standard standard except 1.2 meg and unique DS system
(HD) nice Z80 CP/M system in which CP/M drive acccess is parallel only
thus faster.

==> Atari 1450XLD drives
DS SD/ED DD? standard, requires DOS4. unusual DS system
Only prototypes exist.

==> KARIN MAXI
Double head disk drive 360 KB/5,25" or 720 KB/3,5", controller WD 1772.
Available formats:
= standard SS/SD 90 KB
= standard SS/ED 130 KB
= standard SS/DD 180 KB
= 'cylindric' DS/DD 360 KB (XF551 uncompatible)
= 'cylindric' DS/QD 720 KB (TOMS-compatible; 720 KB drives only)
Any other capabilities depend on a special software.
Transmission mode:
- parallel: real speed 11.25 kilobytes per second with DOS or 22.5 kilo-
bytes per second with special track-copier.

Notes:
Because of the 1772-registers available in 6502 i/o pages ($D100),
the KARIN MAXI drives look full-programmable.
Preferred systems: MYDOS, SDX.

==> XFD-601B
Double head 360 KB/5,25" disk drive. Controller WD 1772, CPU 8051.
Available formats:
- standard SS/SD 90 KB
- standard SS/ED 130 KB
- standard SS/DD 180 KB
- standard DS/DD 360 KB (XF551 compatible)
Transmission modes:
- normal 19200 bps
- Top Drive 1050 70000 bps
What's Top Drive? Konrad M.Kokoszkiewicz, mailto:draco@mi.com.pl writes:
the command is sent as 19200, but all other communication (acknowledge,
data block, completion) is done at 72000 (IIRC).
- Indus GT (synchromesh) 70000 bps (GTSYNC.COM and INDUS.SYS are not necessary;
full-compatible with the SDX)
- UltraSpeed 70000 bps (full-compatible with the older SpartaDOS)
Notes:
Customized sector skew. In fact, the XFD-601B is a original clone of the
XF551.
288 RPM

==> XFD-602B
The two XFD-601B drives in the one unit.

Subject: 12.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written. volunteers?

- Amdek
- XF551 upgrades (CSS)
- Floppy Board (CSS)
- Percom drive upgrades

==> Atari XF351 or XC35
3.5" system Unreleased

Subject: 12.3) What do I need to connect a hard drive to my 8-bit Atari?

original by mailto:Krishna@max.tiac.net (Glenn M. Saunders)

For starters, you'll need to obtain one of the following interfaces:

==> Corvus hard drive (10 megabytes)
Rare.
Fast but still relatively slow I/O, kludge through joystick ports for 800.

==> KPI Hard Disk Drive Interface (formerly Supra)
from K-Products (bobkla19@mail.tcd.net - Bob Klaas)
Some limitations on drive type and size and total number of drives in sys.

==> Multi I/O (MIO) (formerly from ICD)
from Fine Tooned Engineering (FTe) (ftooned@crl.com - Mike Hohman)
256 byter per sector restriction. 256K and 1 meg ramdisk models.
Printer and modem, modem will handle 19.2K bps

==> Black Box
from Computer Software Services (CSS) (mailto:audioguy@cheerful.com - Bob Puff)
Will handle all SCSI drives. Allows 9 drive access for MYDOS. Currently the
only modem interface with CTS/RTS hardware flow control. 19.2K ready.

==> SWP ATR-8000
Rare daughterboard for hard drives.
I/O is probably fairly slow on this baby and there may be DOS restrictions.

==> IDE Hard Drive Interface
from Konrad M. Kokoszkiewicz and Jacek Zuk
(see http://www.orient.uw.edu.pl/~conradus/docs/ide_eng.html)
o Maximum drive capacity: 16777215 physical blocks on each device.
o Maximum number of partitions: 16
o Maximum capacity of a partition: 16777215 logical sectors
o Logical sector length: 256 or 512 bytes
o Average speed (in kilobytes per second, WDC 130AB drive):
- Native mode, sequence of sectors (R): 75
- Emulation mode, sequence of sectors (R): 43
- Emulation mode, back sequence (R): 28

http://www.kawo2.rwth-aachen.de/~matz/atari/
* real device for the parallel-port of the Atari XL-Series
* up to 240 partitions per harddisk supported
* emulates D1: until D9: of disk devices (access to 9 partitions at
one time)
* full bootable from any partition (with standard XL-OS)
* write protectition capability
* supports master/slave configuration

* more than 30 KB/s file access with SPARTA-DOS 3.2 gx (reading)
* more than 10 KB/s file access with SPARTA-DOS 3.2 gx (writing)
* access of ATAPI-CDROM with additional software

Subject: 12.4) What kinds of monitors can I use with my Atari?

In general, you either need a Composite Video monitor, or a standard TV.

Television:
You'll need a video cable (not detachable on the 400/800), and a TV Switch Box. Used with VHF Channel 2 or 3.

Monitor:
The 8-bit Atari produces a color Composite Video signal, plus separate chroma (color) and luminance (brightness) signals which the best composite video monitors can take advantage of. Popular examples of such monitors include the family of monitors produced by Commodore.

Gotcha's:

-the 400 and North American 600XL lack a monitor port entirely. They can only be used with a TV.

-the XE Game System provides an RCA-style jack in place of the Monitor port; so it provides Composite Video but lacks separate chroma\luma signals

-the 600XL, 800XL and 1200XL lack separate chroma signal (can be added via hardware modification)

-the XEP80 Interface Module produces a monochrome Composite Video signal via an RCA-style jack. This higher-resolution signal produces crisp, clear 80 column text on 80-column monochrome composite video monitors.

The pinout of the Monitor port is in the pinout section of this FAQ list. The monitor connector on the back of the Atari can be utilized using a 4-pin DIN to RCA converter. You don't need to build a separate cable.

mailto:buesch@srv.net (Brent Buescher, Jr.) writes:

"The best monitor for an Atari 8 bit that is readily available today would be a television with an S-video input---these tend to be large and high-quality, so the s-video input is the deciding factor there. You'll have to build the cable yourself, and if you have an XL you'll want to do the Super Video upgrade that Ben Poehland published in Atari Classics a few years ago---this puts the chroma signal back on the pin that it should be and cleans up the video signal enormously. It's really more of a fix than an upgrade.

I use a commodore split-video monitor. They work great and are cheap-to-reasonable when you can find them."

mailto:bryede@emi.net (Bryan Edewaard) writes:

"Yes, the best choices are monitors that support "Separated Video" (sometimes called Commodore video on Commodore monitors), or S-Video. These monitors have separate color and luminance video inputs, which give a sharper picture without cross-color artifacts - such as the colored fringes on text when viewed on a TV (although some games use these artifacts to get additional colors). If you have an XL computer, then it needs an upgrade to support these monitors due to the omission of chroma from the monitor port. the 800 and XE computers don't have this problem.

The 2nd best choice is a TV or monitor that has a "Composite Video" (usually called just "Video" or "Aux") input. This is a signal that has the color and luminance information combined into one signal. The picture will be a little less sharp, but still much better than using the "Channel 3" output.

>Where might I find one?

I've seen them a flea markets, garage sales, swap meets, ham fests, and in newsgroups like this one. Plus, many new TV's support S-Video and Composite video inputs.

>What are the advantages of using one of these rather than a TV?

Well, it's all a matter of how many stages the signal must go through.

1. The Atari generates video as a color signal and a brightness (luminance) signal. These are passed to the monitor port as Chroma and Luma signals (XL's have no Chroma output from the factory).

2. The signals are mixed together to make a standard video signal which is also passed to the monitor port as Composite Video.

3. Then the mixed video signal (along with audio) goes through the process of being "modulated" into a TV radio signal (channel 3 or 4). This step involves removing high frequencies from the video (blurring it) and sending it to the TV in a fragile broadcast form that's suseptable to all kinds of interference. Then the TV must (1) extract the video signal from the radio signal, (2) separate the Chroma and Luma components as best it can, then (3) divide the Chroma in R, G, and B. Any of these steps that you can eliminate will help your picture.

>Are there any other composite video monitors that anyone would recommend
>(and where might I find one)?

Maybe the 8-bit FAQ mentions these monitors. The most common one is probably the Commodore 1702 which has a very good picture and is quite reliable.

If you plan to use an XL (which I do), upgrading the video circuitry makes as big a difference as what monitor you choose. Ben Poehland has some excellent articles in Atari Classics magazines for improving the quality of the XL's video, as well as restoring the missing Chroma output."

Lonnie McClure mailto:lmcclure@ibm.net has the last word on Commodore monitors:

Comodore models: 1701, 1702, 1802, CM-141, 1080, 2002, 1902, 1902A*, 1084**, 1084S**.

* The 1902A used a DIN connector for chroma/luma, which makes cabling a bit more of a problem. The composite and audio connectors are standard RCA jacks, however.

** The 1084 and 1084S had more than one version. Some used the a DIN connector for chroma/luma connections, like the 1902A, while some used standard RCA jacks.

The 1902 and 1902A are very different in appearance. The original 1902 shares the same slightly rounded front case design as the 1080 and 2002, while the 1902A is has a rather square case design, and was manufactured by Magnavox (as were some of the 1084 and 1084S versions).

Jerry Jessop, mailto:jjessop1@home.com explains why French Ataris produce fewer colors:

"I will tell you why it only has monochrome out, because it's SECAM and a SECAM GTIA was never produced. The PAL GTIA is used in France and the Lum outputs are run into an onboard encoder to produce a "psudo" color depending on the Luminance output, composite only. This is why a SECAM VCS or 800 has nowhere near the same number of colors (16) availible as a PAL or NTSC unit (256).

The FGTIA was never completed as the market size did not warrant the expense. The largest SECAM market is not France but the Soviet Union (former) and in 80-84 sales of these items there were not possible."

Subject: 13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system.

Either MYDOS or SpartaDOS will work with almost any disk drive, up to 8 drives or hard disk partitions, and ramdisk.

MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. MYDOS 4.53 is freeware from Wordmark Systems (Charles Marslett and Bob Puff). There are two versions of MYDOS 4.53, one uses 3 digit sector numbers where possible, known as 4.53/3; the other, known as 4.53/4, uses 4 digits minimum. Complete documentation about the disk formats and commands, as well as the source code, is available.

SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g and 3.2gx are disk-based; SpartaDOS X 4.22 is cartridge-based and includes many additional features. SpartaDOS 3.3a and 3.3b were rewritten by Stephen J. Carden for use with BBS Express PRO!. SpartaDOS 3.3c is

produced on a 16K ROM cartridge from Video 61.

It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
filenames: Os/dos25.arc (DOS 2.5)
Fte/fte32g.arc (SpartaDOS 3.2g)
Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Another popular, powerful DOS is BW-DOS, freeware by Jiri Bernasek.
BW-DOS 1.30 and all other versions are available via:
http://atari.boss.com.pl/files

Carolyn Hoglin, mailto:choglin@usa.net adds:
I didn't see TOP-DOS mentioned anywhere. This superior DOS was written by R. K. Bennett of Eclipse Software in Sunnyvale, CA. It was based on Atari DOS, but with many, many more features. It fully supports my double-density, double-sided Astra drives, automatically sensing the proper density and sidedness of both drives 1 and 2. (MYDOS only seemed to do that on drive 1.) Also supported are large ramdisks for Axlon, Mosaic, etc. The latest version was TOP-DOS 1.5+, which came with an excellent manual explaining how to use its powerful capabilities.

Any other versions of DOS all 8-bit Atari users should be aware of??

Subject: 13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 Home Computer (1979) 8/16K, membrane keyboard, 400/800 OS
800 Home Computer (1979) 8/16/48K, two cartridge slots, 400/800 OS
1200XL Home Computer (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL Home Computer (1983) 16K, BASIC, PBI, XL OS
800XL Home Computer (1983) 64K, BASIC, PBI, XL OS
65XE Personal Computer (1985) same as 800XL minus PBI (Europe: includes ECI)
130XE Personal Computer(1985) same as 65XE with 128K plus ECI
800XE Personal Computer(1987?)same as 130XE but 64K. Mostly eastern Europe.
XE Game System (1987) same as 65XE plus Missile Command, detach keybd

Peripherals:
410 Program Recorder -Japan and Hong Kong versions. 410a - Taiwan version
810 Disk Drive -SS/SD 90K with DOS 1 or DOS 2.0S,MPI&Tandon vers.
820 40-Column Printer -
822 Thermal Printer -40 col.
825 80-Column Printer -req. 850
830 Acoustic Modem -300 baud req. 850, w/ Telelink I. =Novation 'CAT'
835 Direct Connect Modem -300 baud, with Telelink II software
850 Interface Module -4 9-pin serial, 1 15-pin parallel ports, beige & black metal versions

1010 Program Recorder -Sanyo and Chelco versions
1020 Color Printer -40 col.(80 by command) print/plot in 4 colors
mailto:rrs0059@ibm.net (Frank McKenney) writes:
The printer/plotter mechanism for the Atari 1020 is
(I believe) the same one used in the Tandy/Radio
Shack CGP series and the Commodore 1520(?), and
was
made by a company named ALPS.
1025 80-Column Printer -7-pin dot matrix. =Okidata ML80. 40cps
1027 Letter-Quality Printer-80 col letter quality =Mann-Tally Riteman LQ. 20cps
1029 Printer -7-pin dot matrix, same as Commodore MPS-801
1030 Direct Connect Modem -300 baud, with ModemLink software. 2 SIO ports
1050 Disk Drive -SS/ED 128K with DOS 3 or DOS 2.5
1064 -64K RAM module for 600XL
XC11 Program Recorder
XC12 Program Recorder
XCA12 Program Recorder
CA12 Program Recorder
XC13 Program Recorder -XC12 which was "T2000 ready". Czech/Slovak/Poland
XL12 Program Recorder -XC12 w/slight changed design. Czech/Slovak/Poland
XM301 Modem -300 baud, w/ XE Term software. Permanent SIO cable
XMM801 Printer -80 col. Ribbon: Mannesman/Tally MS80
XDM121 Printer -80 col.letter quality. Ribbon: Silver Reed CF130
XF551 Disk Drive -DS/DD 360K with DOS XE
XEP80 Interface Module -80 col. video display and DB25 parallel port
SX212 Modem -1200 baud, rarely with SX-Express! package.
SIO & DB25 RS232 serial ports.external power supply

Atari 8-bit vaporware computers: (note some are more vaporous than others)
800D (Developers Bus System)
1000 Sweet 16 Project, lower end model. Became the 1200XL
1000-X Sweet 16 Project, higher end model. Became the 1200XL
1200 1200XL internally, many slight cosmetic differences
1200XLS 1200XL Show prototype, top-mounted cartridge slot
600 early 600XL, all black case, joyports on the left, missing PBI
800XL brown prototype
800XLF late 800XL with a redesigned motherboard, plus the FREDDY chip
800XLD low-cost 1450XLD, no modem&speech, include disk drive
controller&FREDDY
1250XLD Earlier name for the 1450XLD
1400XL brown prototype
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL 1400XL plus room for 2 internal 5.25" drives (controller not included)
1450XLD 1400XL plus 5.25" floppy drive (Epson SD521 360K disk drives)
1600XL Amiga/Amiga-like.Now appears that 1850XLD was the model name for this
1650XLD to use 1450XLD case and 1200XL keyboard

1850XLD "Mickey" Atari clone of the Amiga Lorraine
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE/AMY sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D
816 ????
1053 -looks like a 1050, but supports DS/DD 360K format
1055 -a 1050 (SS/ED) with a 3.5" mechanism
1060 CP/M Add-On Module -"SweetPea" Z-80 CPU, 64K RAM, CP/M 2.2, 80 col display
1090 XL Expansion System-5 PBI slots, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XF351 -a 3.5" drive.
XC35 -an XF551 with a 3.5" mechanism
XTM201 -non-impact printer
XTC201 -XE Thermal Color Printer

Subject: 13.3) What are the power-supply requirements for my Atari components?

Thanks to Matthias Belitz, mailto:matz@kawo2.rwth-aachen.de for the European data in this section. I need more international help!

As with the rest of this FAQ list, please let me know if any of this information conflicts with the units you have.

The most important information is the voltage (in volts) required, and whether you need a transformer (AC output) or an adapter (DC output). The power (in watts) and current (in amperes) specifications of the original equipment as presented here should be regarded as minimum values. Higher-than-specified power and current capacities are entirely usable, and often preferable because such supplies run cooler and last longer.

Relevant law of physics:
Power (in watts) = current (in amps) * voltage (in volts)
VA=VoltAmps

N O R T H A M E R I C A: INPUT = 115-120 V AC, 50/60Hz

Subject: 13.5) What BBS software can be used on the Atari?

This section mostly by mailto:winston@merk.com (Winston Smith)
Credit for AMIS to MACE by Steven Sturza, mailto:cordata@ameritech.net

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
The AMIS BBS was written in BASIC by people from the
Michigan Atari Computer Enthusiasts. It included designs for a ring-detector.
You needed a sector editor and had to allocate message space by hand, hex byte
by hex byte.

Steven Sturza adds:
The AMIS BBS was written by people from the Michigan Atari Computer
Enthusiasts.

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer, mailto:msinger@oe.fau.edu writes:
FoReM BBS derived from an early AMIS. When multiple message areas were
added the name was extended to FoReM 26M. Then, When OSS released BASIC
XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most
of the Assembler routines (where is he now?).

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported
features such as intra-line editors. Unfortunately, the coding of the
ABBCS was really poor. You could practically blow on your keyboard and
crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston,
Massachusetts, USA, area. I'm not sure whether his BBS for the
Atari 8-bit has been placed into the public domain or not. This BBS was
the first to support a RAMdisk, which Paul Swanson called a "V:" device
for "virtual disk". This BBS was written in Atari BASIC and required a
joystick hardware "dongle" device. This was notable as being one of the
first Atari 8-BIT BBSes that could actually go for a week without having
to be rebooted. Pointers to the message base were kept in an Atari "very
long string" (for which Atari BASIC is famous). The BBS would only have
problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of
the commercial BASIC XE cartridge to run. This BBS program was very
popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It
expects to be running under a SpartaDOS environment. This was a problem
until very recently, when the disk-based version of SpartaDOS was
re-released as shareware. This BBS program uses a "modem clock string"
rather than an R-Time 8 cartridge in order to retrieve the current time.
It also comes with an Atari BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BASIC XE
cartridge in order to run. It is in the public domain and can import and
export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only,
control ATASCII graphics are reserved for message data-structure bytes).
FOREM-XE BBS is still currently in use as we speak, and may be reached via
the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in
effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS,
which is the Keith Ledbetter companion project of the EXPRESS!-TERM
terminal program of days gone by. I am not familiar with this program. I
think that it is written in Action! and only supports XMODEM Checksum
transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE--
demo version of the OASIS BBS program. OASIS is very crash-resistant and
comes with a "dial out" screen so that the Sysop can use the BBS as a
terminal program to call and fetch files without having to bring the BBS
down and reload a terminal program. OASIS supports "Door programs" which
it refers to as "OASIS PAL modules". This OASIS demo module comes with an
excellent message system. The OASIS file system is one of the most
complicated that I have ever seen. It consists of "file libraries" with
suites of "file types". There is quite a bit of overhead involved in
performing a download (which may be a good thing, as it discourages file
hogs). There is a commercial version of OASIS called "OASIS IV" that
performs networking. There was an OASIS network between Boston,
Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word
of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank
Walters wrote it.

o Carina BBS -- a shareware product of Shadow Software.

o BBS Express! Professional -- a product of Video 61, www.atarisales.com

o OASIS IV -- a product of ???

o Forem-XE Pro -- by Len Spencer. http://members.aol.com/lenspencer/

Subject: 13.6) What versions of Atari BASIC or the CTIA/GTIA chip do I have?

Atari BASIC:

At the READY prompt, enter "? PEEK(43234)"

If the result is: You have Revision:
162 A
96 B
234 C

Freddy Offenga, mailto:F.Offenga@student.kun.nl adds:

there's another good answer (IMO):

You can also take a look at the part numbers on the IC's
inside your Atari and compare them with the numbers from
the following table:

```
Part# Version
~~~~~~~~~~~~~~~~~~~~~ ~~~~~~~~
CO12402 + CO14502 A
CO60302A B
CO24947A C
```

CTIA or GTIA installed?

In BASIC, type POKE 623,64 [RETURN] and if the screen blackens, you have the
GTIA chip. If it stays blue, you have the old CTIA chip.

By the way, apparently no CTIA-equipped Ataris were shipped to Europe.

Clay Halliwell, mailto:earl.halliwell@dyess.af.mil provides this tidbit:

A bit of trivia: CTIA 400/800s artifacted in blue/green, GTIA 400/800s
artifacted in green/blue, and all XL/XEs artifact in red/blue.

Subject: 13.7) Which versions of the Operating System (OS) are there?

This section also kept at http://www.student.kun.nl/f.offenga/osroms.txt

Atari 8-bit Operating Systems

```
```

3 800XE 03/01/1985 0x29f133f7 C300717
4 XEGS 05/07/1987 0x1eaf4002 C101687

(?) This information is missing. If someone can supply this info,
please write me an e-mail.

NOTES:
The 400/800 O.S's consist of three ROMs (two 4kB and one 2kB).
The 1200XL contains two ROMs for the OS (8k each), XL/XE's use a single
16k ROM and the 16k XEGS OS is stored in a 32k ROM (together with 8k
BASIC and 8k for Missile Command).

Origins of ROM information
~~~~~~~~~~~~~~~~~~~~~~~~~~
400/800 rev.A NTSC Could exist, since the PAL version exists and
rev.A is mentioned in the rev.B source code.
400/800 rev.A PAL All info found in two Atari 400's and Atari 800
ROM module CX801.P
400/800 rev.B NTSC Information from a ROM dump and the rev.B source
listing. The part numbers were listed in the
catalog from 'Best Electronics'. According to
'Mapping the Atari' rev.B ROMs have a 'B' at the
end of the part number, therefore I figure these
part numbers are from rev.B.
400/800 rev.B PAL Could exist, since the NTSC version exists and
there's some conditional PAL/NTSC assembly in
the rev.B source code
1200XL rev.10 PAL/NTSC All info found in an Atari 1200XL. The XL/XE
rev.2 source code refers to it as rev.10.
'Best Electronics' calls it rev.A.
1200XL rev.11 PAL/NTSC Refered to rev.11 by the XL/XE source code.
'Best Electronics' calls it rev.B.
XL/XE rev.1 All info found in an Atari 600XL
XL/XE rev.2 All info found in an Atari 800XL
XL/XE rev.3 All info found in an 800XE
XL/XE rev.4 All info found in an Atari XE Game System

O.S. Authors and dates
~~~~~~~~~~~~~~~~~~~~~~
The following info is from the Atari XL/XE rev.2 source code.

Revision A (400/800)
D.Crane / A.Miller / L.Kaplan / R.Whitehead

Revision B (400/800)
Fix several problems.
M.Mahar / R.S.Scheiman

Revision 10 (1200XL)
Support 1200XL, add new features.
H.Stewart / L.Winner / R.S.Scheiman /
Y.M.Chen / M.W.Colburn 10/26/82

Revision 11 (1200XL)
Fix several problems.
R.S.Scheiman 12/23/82

Revision 1 (600XL/800XL)
Support PBI and on-board BASIC.
R.S.Scheiman / R.K.Nordin / Y.M.Chen 03/11/83

Revision 2 (600XL/800XL)
Fix several problems.
R.S.Scheiman 05/10/83
Bring closer to coding standard (object unchanged)
R.K.Nordin 11/01/83

Vapour-ware
~~~~~~~~~~~
The following OS roms originate from rare Atari 8-bit systems.
Since I don't own any of these (unfortunately), I don't have much
information about these roms. Who can help me?

I've got two 16K rom dumps from the 1450XLD. Both ID's are rev.3.
The first dated 3/23/1984 comes from the 'Pooldisk Too' CD-ROM
(filename: 1540os3.v0) and the second dated 6/21/1984 was send to
me by Nir Dary (filename: os1450.128). Main differences between
these two are in the first 3K ($C000 - $CBFF).

The XL/XE OS rev.3B is from an Atari from Arabia. It's probably based
on rev.3. There are changes in the fonts (Arab characters) and several
patches in the code. More info at:
http://www.savetz.com/vintagecomputers/arabic65xe/

Rev.	Found in	Size	CRC-32	Date
3	1450XLD	16kB	0x0d477aa1	3/23/1984
3	1450XLD	16kB	0xd425a9cf	6/21/1984
3B	65XE	16kB	0xf0a236d3	7/21/1984

Subject: 13.8) What games support 4 simultaneous players on the 400/800?

contributors to this section:
mailto:jlodoen@shell.portal.com (Jeff M Lodoen)
mailto:olavese@online.no (Vidar \"Hawk\" Olavesen)
mailto:pmulvey@erols.com (Pat Mulvey)
mailto:stevenposey@usa.net (Steven E. Posey) (Party Quiz controllers descr)

The following games support 4 player head-to-head play. Remember, only the 400 and 800 computer models sport 4 controller ports.

Asteroids, Basketball, Dandy, M.U.L.E., Maze War, Silicon Warrior, Survivor, Thorn EMI Soccer, Major League Hockey

The following support 8 players on the 400/800 or 4 on the other computer models, using the 2 controllers-per-port CX30 Paddle controllers:

Super Breakout, Worms?

The following supports 4 players on all machines, using special 4-button keypad controllers linked together with RJ-11 jacks (standard phone jacks) to a box with 2 joystick port connectors.

Party Quiz by Suncom

Subject: 13.9) Why should I disconnect the 810/1050 power supply before connecting or disconnecting SIO cables?

Rich Mier writes:

You've been plugging and unplugging the SIO cable with the 1050 power pack plugged in, right? That's a no-no. Most of the time it's Okay, but about 1 in 10, 20 times, it will blow out 'U-1'. It's a CA/LM 3086 I.C. at the right, rear of the main board. A 14 pin DIL chip. Actually it is an array of 5 transistors.

Unplug the power pack from the 1050, then unplug the SIO cable. Power can be ON on the CPU. The problem has to do with the secondary winding of the Power Pack. Remember, the problem only occurs 1 out of 10 - 20 times that you do it, not all the time.

It doesn't really matter if the 1050 Transformer has power on or off, it 'Might' happen if plugged into the 1050. It is really bad on 810's.

One thing, if the system has been turned off for, oh say, 5 - 10 minutes it won't matter. By then all the capacitors should be bled(sc?) to 0 volts.

Subject: 13.10) What is Omnimon?

--This section was written by Scott Charles, mailto:scharles@blast.net

Omnimon is a add in board for the Atari 400/800 series of computers and a replacement OS chip for the xl/xe series of computers. The original Omnimon

board fit onto the OS board in the 800 series and had a switch attached to it to disable the board. The 400 series required you to bend the circuit board into a right angle for it to fit inside the 400's case. (It was designed to do this.). The Xl/Xe version replaces the OS Rom chip inside the computer with one that contains the Omnimon code, and a revised OS to make the XL more compatible (no translator disks needed).

Omnimon itself is a machine language monitor residing from $C000-$CFFF, with a few variations. It was designed in 1981 by David C. Young (who also wrote Cartcopy, a copier for the right slot of the 800) of CDY Consulting in Texas. The first software revision of Omnimon had a few basic commands and was only 4K long, only for the 400/800. The second revision required the addition of a bank select switch, and was 8K long. Since it was addressed by the 400/800 as 4K, when you needed to use the code in the other bank, all the text on the screen flips upside down, you flip the switch and hit any key. The Xl and Xe versions of Omnimon do their bank selecting through the normal XL port for this function, so it is seamless.

So what can you use Omnimon for? Its main claim to fame is its ability to interupt any running program by pressing and holding the SELECT-OPTION-RESET keys. Depending on the sequence you press determines what kind of warm boot the Atari does. SELECT+RESET does NO warm boot, preserving the stack and flag values of the 6502. OPTION+RESET allows a warm boot (as if you had just pressed RESET) and interupts the vector at $C (initialation vector).

I think you can see where we are going with this - Omnimon was developed as a machine language developer's tool, much in the same way that the Happy modification was developed for legitimate backups. I.E. far more people use both products for software piracy. If you have an Omnimon! in your machine and you try to boot up an Electronic Arts program, for example, you will get a message that says "REMOVE ROM AT $C000", and the program hangs. (Hence,the need for the disable switch on the 400/800 version. There is no way to disable the xl/xe version, just switch it to an alternative OS.) The 400/800 version, since the disable switch just deselects the mapping of Omnimon to $c000 area, can be switched on and off at will.

I myself did not know what Omnimon was used for until I was using a sector editor on a program called Pharaoh's Pyramid, from Master Control Software. On it is a sector that reads, "REMOVE OMNIMON YOU DIRTY PIRATE". This got me to thinking, what does that mean? After about 5 months of playing around with the Omnimon board, I figured out how to use it to pirate software. In fact, it can be used to make most boot disks into binary files, and remove copy protection from countless more.

At the risk of sounding melodramatic, I can safely say that Omnimon hastened the demise of the Atari 8 bit computer by 2-3 years, because of its power.

Subject: 13.11) What is the difference between NTSC and PAL machines?

Software written for NTSC (North America) will always work on PAL machines, but software designed on PAL machines (Europe) won't necessarily work on

NTSC machines.

Wayne Booth, mailto:trek@ihgp15.ih.att.com writes:

The differences with PAL and NTSC have to do with the number of lines displayed on the screen and whether they are using 50 or 60 Hertz.

If I remember correctly, I believe PAL has 625 lines/screen and they refresh the screen 50 times a second doing 1/2 the lines each refresh so they effectively repaint the screen 25 times a second. NTSC is 525 lines/screen with a 60 times a second refresh - again only half the lines each refresh so a 30 times a second frame rate. This would change the amount of time available during vertical sync pulse, and the number of lines that need to be redrawn each time.

Graham Thornton, mailto:nero@chicagonet.net adds:

I use both a real PAL Atari 800 and a PAL-ANTIC 1200XL here in the US.

Replacing the ANTIC chip with a PAL version changes the screen refresh rate to 50Hz which allows most of the PAL-only European software to run. Your system will still report itself as a NTSC machine, unless you change the ROM (see the Nir Dary upgrade), but most software doesn't care.

The one problem you might run into is your monitor. Replacing the ANTIC will mean your North-American Atari is now generating an NTSC signal at 50Hz, instead of the usual 60Hz. Some people will tell you that modern TVs and monitors don't care but that isn't actually true. My brand-new Sony Trinitron 15" colour TV/monitor goes bezerk with the upgraded 1200XL, but my 15-year old 10" Texas Instruments color monitor (designed for the TI-99/4A) is fine.

You can also use real European equipment here in North America, provided that you have a PAL-compatible TV/monitor. The frequency of the power system is irrelevant, as I use my 800 with a 110V/60Hz 1050 power supply.

Subject: 13.12) Is the software for the Atari 8-bit computers "TV-standard dependent?"

{some PAL demos flicker, or won't run at all on NTSC machines}

mailto:buesch@srv.net (Brent Buescher, Jr.) writes:

This is because PAL machines have a vertical refresh frequency of 50hz (NTSC use 60hz) which translates into more vertical blanking time for demos and other computation-intensive graphics software. So PAL demos that won't work on NTSC machines are usually returning from a VBI (vertical blanking interrupt) too late. Some also attempt to use more vertical resolution ("longer" display lists) than an NTSC display can handle.

mailto:thor@math.tu-berlin.de (Thomas Richter) adds:

Yes, it is. Mostly because the frequency of the vertical blank interrupt
is different (60Hz for NTSC, 50Hz for PAL). The old OS A was not clever enough
to notice the difference, so all system timings like the keyboard auto-repeat
function depend on the TV system. These parts of the OS have been corrected
with OSB and the XL versions of the OS. However, as most games install a
VBI, their timing does still depend on the frequency -> they will run
slightly slower for PAL versions.

Another point is that the popular pseudo-colors used in the Antic-F
(Graphics 8) mode are not colorful at all when displayed on a PAL TV, because
of differences in the color encoding for the TV. The schematics of
the Xl computers include however a hack how to change the PAL version to
the NTSC version (the PAL versions include two crystals, one with 5/4th of
the frequency of the other. One is used for the system clock, the other for
the color clock), but I never dared to apply it.

Subject: 13.13) What programming languages are available for the Atari?

This section also kept at http://www.student.kun.nl/f.offenga/lang13.txt

Revision : 1.3
Date.... : 4/19/1999

==========
!!!! This section is under construction - HELP WANTED !!!!

The goal is to give information about all available languages
for the Atari 8-bit computer. This information will include:
title, last version, author, date and a short description.
It would also be nice to know how to get it and where to get
more information (like reference cards, reviews and such).

Freddy Offenga, mailto: F.Offenga@student.kun.nl
==========

There are quite a lot! To get some structure in this section it's
divided into the following categories;

a) ASSEMBLER
b) BASIC
c) C
d) PASCAL
e) LISP
f) FORTH
g) PILOT
h) LOGO
i) All the rest

The following format is used:

- Language titel (medium)
version, year : version, year
author/company : author/company

available..... : where/how to get it
package..... : programs, documentation
features..... : main features
Description.

The question marks (?) indicate that more information is
required about that topic.

Definitions:
umich University of Michigan Atari archive

Some resources:
- The Multi-lingual Atari, Analog magazine 45, August 1986
- A bunch of manuals
- Some copy-pasted lines from the Atari 8-bit newsgroup

a) ASSEMBLER

- 130XE+ Makro Assembler (disk)
version, year : 2.2, 1992
author/company : Torsten Karwoth
available..... : freeware, ?
package..... : assembler, editor, menu, monitor,
batch enhancement, linker/packer
features..... : macros
Two pass 6502 assembler with integrated menu, editor
and monitor shell. Needs extra RAM banks. Source
format is derived from Atmas Makroassembler.

- A65 (disk)
version, year : ?, 1989
author/company : Charles Marslett, WORDMARK Systems
available..... : freeware, ?
package..... : assembler, manual
features..... : source include
Two pass 6502 assembler. Source format is based on the
Atari Macro Assembler. Assembler source included.

- Alfasm, Turbo-Assembler/16 (disk)
version, year : 1.0, 1990
author/company : Jeff Williams, DataQue Software
available..... : ?
package..... : assembler, docs
features..... : source include
Two pass 6502/65816 assembler.

- Atari Assembler/Editor (cart)
version, year : ?, 1981
author/company : Atari
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : -
Two pass 6502 assembler with integrated editor/monitor

- Atari Macro Assembler (disk)
version, year : 1.0C, 1981
author/company : Atari, APX
available..... : ?
package..... : assembler, editor, debugger, manual
features..... : macros, source include
Two pass 6502 assembler.

- Atmas Makroassembler (disk)
version, year : 2, 1985
author/company : Peter Finzel, Hofacker
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : macros
Two pass 6502 assembler with integrated editor/monitor.

- Bibo Assembler (disk)
version, year : ?, 1986
author/company : Compy-shop
available..... : ?
package..... : assembler, editor, monitor
features..... : source include, data include
Two pass 6502/65c02 assembler with integrated editor/
monitor.

- Datasm/65 assembler (disk)
version, year : 2.0, 1981
author/company : DataSoft Inc.
available..... : ?
package..... : assembler, editor, menu, manual
features..... : -
Two pass 6502 assembler.

- EASMD (disk)
version, year : 1.0, 1981
author/company : OSS
available..... : ?
package..... : assembler, editor, monitor
features..... : ?
Two pass 6502 assembler with integrated editor/monitor.

- Fast Assembler (disk)
version, year : 1.5, 1995
author/company : MMMG Soft
available..... : ?
package..... : assembler, editor, disassembler
features..... : ?

- Kasm65 (disk)
version, year : 2.41, 1994
author/company : Ken Siders
available..... : shareware, umich
package..... : assembler, editor, linker, docs

features..... : macros, relocation, source include,
conditional assembly
Two pass 6502 assembler. Relocatable object files are
compatible with ra65. Source format is derived from
the Atari Macro Assembler.

- MAC/65 Macro Assembler (disk|cart)
version, year : 2.00, 1982
author/company : Stephen D. Lawrow, OSS
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : macros, source include
Two pass 6502 assembler with integrated editor/monitor.
Mac/65 is a direct descendant of the Atari Assembler/
Editor (via EASMD).

- MAE (disk)
version, year : .96, 1996
author/company : John Harris
available..... : umich
package..... : assembler, menu, editor, monitor, docs
features..... : macros, source include, data include,
conditional assembly
Two pass 6502/65816 assembler with integrated editor/
monitor. Extra RAM supported.

- NASM65 (disk)
version, year : ?, 1992
author/company : Nat!
available..... : ?
package..... : assembler, linker, librarian
features..... : macros, relocation, source include
One pass 6502 portable cross assembler (initially for
the ST). Highly compatible with MAC/65.

- PC-65 (disk)
version, year : 1.0 beta, 1996
author/company : Jan Feenstra & Freddy Offenga
available..... : mailto: F.Offenga@student.kun.nl
package..... : assembler
features..... : macros, source include, data include,
boundary directive
Two pass 6502 cross assembler for the PC. The source
format is highly compatible with the ST-65 assembler.

- Quick Assembler (disk)
version, year : 1.0, 1990?
author/company : JBW, Avalon?
available..... : ?
package..... : assembler, editor, menu, debugger
features..... : source include
Two pass 6502 cross assembler with integrated editor.

Very user friendly menu environment.

- Ra65 (disk)
version, year : 1.0, 1989
author/company : John R. Dunning
available..... : public domain, umich
package..... : assembler, linker, librarian
part of cc65 (c-compiler)
features..... : ?

- Synassembler (disk|cart)
version, year : ?, 1982
author/company : Steve Hales, Synapse Soft
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : source include
Two pass 6502 assembler.

- ST-65 (disk)
version, year : ?, 1991
author/company : A. Stauffenberg, F. Offenga
available..... : mailto: F.Offenga@student.kun.nl
package..... : assembler, menu shell, manual
features..... : macros, conditional assembly,
source include, data include,
boundary directive
Two pass 6502/65c02 cross assembler for the Atari ST
written in 68000 assembly. As far as I know this is
the first assembler with the boundary directive.

b) BASIC

- A BASIC Compiler (?)
version, year : 1.03, ?
author/company : Monarch Data Systems
available..... : ?
package..... : BASIC compiler
features..... : ?

- Advan BASIC (disk)
version, year : ?, ?
author/company : Advan Language Designs
available..... : ?
package..... : BASIC compiler
features..... : ?

- Atari 800 Basic (disk)
version, year : 1.0, 1981
author/company : Microsoft
available..... : ?
package..... : ?
features..... : ?

- Atari BASIC (cart)
version, year : Rev.C, 1983
author/company : Atari
available..... : standard ROM in Atari XL/XE
package..... : BASIC interpreter, manual
features..... : pretty plain BASIC implementation

- Atari Microsoft BASIC II (cart)
version, year : ?, 1991
author/company : Atari
available..... : ?
package..... : BASIC interpreter
features..... : ?

- BASIC A+ (disk)
version, year : 3.05, 1981
author/company : OSS
available..... : ?
package..... : BASIC interpreter
features..... : ?

- BASIC XL (cart)
version, year : ?, ?
author/company : OSS
available..... : ?
package..... : BASIC interpreter
features..... : ?

- BASIC XE (cart)
version, year : ?, 1985
author/company : OSS
available..... : ?
package..... : BASIC interpreter
features..... : ?

- Turbo Basic XL (disk)
version, year : 1.5, 1985
author/company : Frank Ostrowski, Happy Computer
available..... : ?
package..... : BASIC interpreter, compiler (V1.1)
features..... : ?
Published in the German magazine "Happy Computer".

c) C

- ACE C (disk)
version, year : ?
author/company : John Palevich & Ralph Walden
available..... : ?
package..... : ?
features..... : ?
This is a newer version of 'Deep Blue C'.

- C/65 (?)
version, year : ?
author/company : OSS
available..... : ?
package....... : ?
features...... : ?
Probably derived from Dr.Dobbs "Small C". Compiles to 6502
code which emulates the 8080 instruction set.

- C65 (?)
version, year : ?
author/company : Keith Ledbetter
available..... : ?
package....... : ?
features...... : good macro assembler
This compiler does not support structs.

- CC65 (disk)
version, year : 1989
author/company : John R. Dunning
available..... : ?
package....... : compiler, linker, assembler, librarian
features...... : ?
Public domain compiler. Also used as cross compiler.
Relocatable object linkage files, and the most thorough
K&R C for the 8-bit. Comes with an relocatable assembler.

- CC8 (disk)
version, year : 2.3
author/company : John Palevich & Steve Kennedy
available..... : ?
package....... : Compiler
features...... : ?
ACE C with more "real" C support (e.g. arrays of pointers
to structs). Requires ACE C runtime libs and linker.

- Deep Blue C (disk)
version, year : 1.2, 1982
author/company : John Palevich, APX
available..... : ?
package....... : Compiler, Linker
features...... : ?
Deep Blue C was originally an independent product, but it
then became available from APX. It converts C to pseudo-
code and then interprets the pseudo code (8080 instruction
set emulation).
Drawn from Ron Cain's public domain C-compiler (Small-C).

- DVC C (disk)
version, year : 1.05, 1985
author/company : Ralph E. Walden
available..... : ?
package....... : Editor, Compiler, Optimizer, Linker

features..... : Quite user friendly program
The compiler generates special object files (.CCC)
which can be optimized and linked. The package uses a
special DOS called DVC DOS which contains runtime stuff.

- LightSpeed C (disk)
version, year : 1.08, 1986
author/company : Clearstar Softechnology
available..... : ?
package..... : Compiler, Optimizer, Linker
features..... : ?
Runs under CLI DOS's and MENU DOS's.

- Tiny-C
version, year : ?
author/company : OSS
available..... : ?
package..... : ?
features..... : ?
First sold C compiler by OSS. This compiler was used to
compile itself! First true language "bootstrap" on any
8-bit machine (it was also available for Apple and CP/M
machines). Derived from Dr.Dobbs "Small C". Compiles to
6502 code which emulates the 8080 instruction set.

d) PASCAL

- Atari Pascal (disk)
version, year : 1.0, 1982
author/company : APX
available..... : APX-20102
package..... : ?
features..... : ?

- Draper Pascal (disk)
version, year : 2.1, 1989
author/company : Norm Draper
available..... : ?
package..... : ?
features..... : ?

- Kyan Pascal (disk)
version, year : 1986
author/company : Kyan Software, APX
available..... : ?
package..... : editor, compiler, linker, macro-assembler
and manual
features..... : ?
Kyan Pascal would run off a single floppy. The Atari (APX)
version needs two drives. A version which runs entirely in
128k should be available too.

e) LISP

- INTER-LISP/65 (disk)
version, year : 2.1, 1981
author/company : Special Software Systems, DataSoft
available..... : ?
package....... : ?
features...... : ?

f) FORTH

- ValForth (?)
version, year : ?
author/company : Valpar International
available..... : ?
package....... : ?
features...... : ?

- Extended fig-Forth (?)
version, year : ?
author/company : APX
available..... : APX-20029
package....... : ?
features...... : ?

- fig-Forth (disk)
version, year : 1.4s
author/company : ?
available..... : ?
package....... : ?
features...... : ?

- fun-Forth (?)
version, year : ?
author/company : APX
available..... : APX-20146
package....... : ?
features...... : ?

- Grafik-FORTH
version, year : ?
author/company : ?
available..... : ?
package....... : ?
features...... : ?

- QS Forth (?)
version, year : ?
author/company : Quality Software
available..... : ?
package....... : ?
features...... : ?

g) PILOT

- Atari PILOT (cart)
version, year : 1980
author/company : Atari
available..... : ?
package....... : ?
features...... : ?

h) LOGO

- Atari LOGO (cart)
version, year : 1983
author/company : LCSI, Atari
available..... : ?
package....... : ?
features...... : ?

i) All the rest

- Action! (cart)
version, year : 1983
author/company : OSS
available..... : ?
package....... : compiler, editor, monitor and library
features...... : fast compiler which generates good code
Needs cartridge for runtime procedures. A PD runtime
library is also available.
All variables are static, so recursive routine calls
are not possible. No floating point type (though a
PD library should make this possible). No arrays of
objects (arrays of POINTERS to objects are possible).

- Quick (disk)
version, year : 2.0, 1990
author/company : Raindorf Soft
available..... : ?
package....... : ?
features...... : ?
This is the "poor man's Action!". Same restrictions as
Action! apply also to Quick. Further restrictions are:
only simple assignment expressions, no records and no
pointers.

- Test Computer Language (disk)
version, year : 2.2, 1985-1990
author/company : D.Firth
available..... : public domain, ?
package....... : compiler and editor
features...... : ?

Subject: 13.14) What is the Atari XEP80 Interface Module?

This section written by: mailto:raukamp@dame.de (Thomas Raukamp)

Since the development of the Atari 8-bit line of computers in 1979, users wanted better text displays than the default 40x24. There has been some attempts to satisfy this need, like the Austin-Franklin board or the Ace 80/80xl cartridge. For more informations about these modifications read The Atari 8-bit Hardware Upgrade FAQ from mailto:david_p@storm.ca (David A. Paterson)

The Atari XEP80 Interface Module is Atari's entry to the 80 column field. It lets a XL, XE, 400 or 800 computer system display a full 80 columns across your monitor screen. The XEP80 provides a 256-character wide by 25-line display window. Up to 80 characters are displayed horizontally at once, and you can scroll horizontally all the way to the 256th character, depending on the application you're running. The XEP80 is connected to your system via a joystick port.

The XEP80 Module interprets commands from the computer for screen display or output to a printer. The module is supplied with an industry-standard 8-bit parallel port so you can connect a parallel printer to your Atari 8-bit (I even use a HP LaserJet IV on my 130XE ;)).

All programs that use the standard screen call (E:) should be compatible with the XEP80 Module. The software provided by Atari supports a 320x200 graphics mode - this mode only support direct bit images. Note that you can't use all of the standard graphic capabilities of the Atari anymore.

Although Atari recommends a monochrome monitor for usage with the XEP80, it runs fine with any type of composite monitor. The output looks great on my Commodore 1084 for example.

Along with the module comes a software-package containing an AUTORUN.SYS file, which is the XEP80 handler. If you want to use the module with an application that is compatible with the XEP80, which has it's own AUTORUN.SYS file, you can append the application's AUTORUN.SYS on the module's AUTORUN.SYS.

Subject: 13.15) What makes some XL/XE software incompatible with the 400/800?

Konrad M.Kokoszkiewicz, mailto:draco@mi.com.pl writes:

XL/XE software won't work on 800 if:

1) it uses shadow RAM at $C000-$CFFF and $D800-$FFFF
2) it uses RAM expansions at $4000-$7FFF controlled by PORTB $D301
3) it uses specific XL OS functions (like JNEWDEVC)
4) it uses illegal XL OS addresses.
5) it uses European Charset :)

Subject: 13.16) What games run only on the 400 and 800 models?

The following are reported as incompatable with models other than the original Atari 400/800. Most probably do work on XL/XE's if you use a translator to run the original 400/800 OS on your XL/XE.

Apple Panic Broderbund
Aquatron Sierra On-Line

Subject: 13.17) What games make use of the Light Gun?

mailto:jmouchmino@aol.com (Bertrand M. (LEXX)) writes:

Bug Hunt, Barnyard Blaster, Crossbow, Crimebuster, Operation Blood, Operation Blood II - Special Forces (not completely sure about that one), Light Gun Blaster (PD), Gangsterville (Italian game written in BASIC), maybe a couple more...

Bertrand M. (LEXX)

James Bradford mentions:
"On the 400, the light gun /pen will only work in joystick port 4." This renders much light gun and light pen software unusable on the 400.

Subject: 13.18) How do I type a tilde (common character in Web URL's) on my Atari?

The Shadow, mailto:The_Shadow@spnt.com writes:

The question is: "How do I type the tilde or squigly line which is in most web addresses? I don't have a key for it..."

Answer: The tilde is an inverse backspace on the Atari 8-Bit which can be very hard to type depending on the term program you are using, however you can insert the hex equivalent very easily, which is %7e in place of the tilde and it will work just perfectly. Do not put a space either before or after the %7e.

I (Michael) add:

Some advanced Atari software supports the tilde character natively. E.g., you can type a tilde in Ice-T with the Atari Logo/Inverse Video key.

Subject: 13.19) What's the difference between ASCII and ATASCII?

David Moeser -- erasmus att iglou dott com -- produced this nice translation table.

ASCII TRANSLATION TABLE -- IBM & ATARI 8-BIT (ATASCII)

Subject: 13.20) What are the PAL, NTSC and SECAM video broadcast standards?

Here are several links on the topic.

http://www.ee.washington.edu/conselec/CE/kuhn/ntsc/95x4.htm

http://www.alkenmrs.com/video/standards.html

http://www.ee.surrey.ac.uk/Contrib/WorldTV/

Subject: 14.1) What vendors, developers, or publishers support the 8-bit Atari?

See the "Atari 8-Bit Computers Vendors and Developers List." Available via:

http://www.faqs.org/faqs/atari-8-bit/vendev/

and Usenet FAQ archives everywhere.

Or you can always ask me for a copy at mailto:mcurrent@carleton.edu

----

Subject: 14.2) Where is my nearest 8-bit Atari BBS?

Trevor Holyoak, mailto:trevor@holyoak.com maintains the "Atari BBS List."

http://www.holyoak.com/atari/

Subject: 14.4) I'm new to the Atari. How do I use this thing?

"The Atari 8-bit New User, Emulator Help FAQ" is maintained by mailto:bill@newbreedsoftware.com (Bill Kendrick). Bill and his FAQ are excellent sources for information on basic usage of the 8-bit Atari, and for information on the 8-bit Atari emulators which run on other computing platforms.

See: http://www.sonic.net/~nbs/new_and_emu.html

If you'd like a text-only copy, simply send e-mail to mailto:bill@newbreedsoftware.com with the subject:

send emulator faq

Subject: 14.5) Can I use an emulator to run my old Atari software on my new computer?

"The Atari 8-bit New User, Emulator Help FAQ" is maintained by mailto:bill@newbreedsoftware.com (Bill Kendrick). Bill and his FAQ are excellent sources for information on basic usage of the 8-bit Atari, and for information on the 8-bit Atari emulators which run on other computing

platforms.

See: http://www.sonic.net/~nbs/new_and_emu.html

If you'd like a text-only copy, simply send e-mail to
mailto:bill@newbreedsoftware.com with the subject:

send emulator faq

Subject: 14.6) What hardware upgrades, modifications and add-ons are available?

The Atari 8-bit Hardware Upgrade, Modification and Add-On FAQ is maintained by
David A. Paterson, mailto:david_p@storm.ca or see:

http://www.geocities.com/SunsetStrip/Alley/1878/hard_faq.htm

Subject: 14.7) What is the HARD-Interlacing-Picture (HIP) format?

HIP is a new method to displaing pictures on small atari...

HIP stands for HARD-Interlacing-Picture and was found by
Members of HARD Software, Hungary in June, July 1996...

It enables to display 160 x 240 Pixels with 30 shades without
nearly all flickering (depends on the source-picture you use)...
HARD stands not for HARD or HEAVY Interlacing, just for the
inventors...

For more information, see the HIP-FAQ, located at:
http://www.uni-karlsruhe.de/~Marek.Tomczyk/Atari8/hipfaq.html

or contact HeAvEn at mailto:k_nadj@s-direktnet.de

Subject: 14.8) How do I access Usenet, FTP, Gopher, and WWW by e-mail?

The Accessing the Internet by E-Mail FAQ is maintained by "Doctor Bob" Rankin,
mailto:BobRankin@MHV.net or see:

http://www.faqs.org/faqs/internet-services/access-via-email/

Holding OPTION while turning the power on disables BASIC.
Holding START while turning the power on begins a cassette boot.

If you have a machine language boot cassette you need to hold down both keys.

> > for one.

> If he wants to do so, he could still enable Basic with a "hardware" switch.

The other (quick and cheap) option is to dump the built in BASIC to a
binary file on disk, and then run it from there. Copy the file into
your ramdisk when you start up and you've got quick access to it from
DOS. The disadvantage is that your BASIC is now in RAM, and can be
trashed if your BASIC (or any other) program POKE's into the wrong place.

1591. Tutankham: Was it ever released on cart?

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-07 00:00:00 UTC
From: krieg@earth.execpc.com
Message-ID: <38c55c38$0$19365@news.execpc.com>
Source record: 46152

I know a binary for this file exists, and it is the proper size to be a cart dump. But I've yet to come across anyone who has, or has seen a cart for this game. Does anyone on here have one?

Was it ever released on disk or cassette?

The binary appeared around the same time pirates released "Behind Jaggi Lines", so I'm wondering if this was a pirate binary of a cart that was never released.

I don't know what the original poster is talking about. "Star Trek: Strategic Operations Simulator" *was* released by Sega. This is most likely a pre-release prototype of the game, worth about what it went for ($30). Not a rare game by any means.

Hi Yes,

I noticed the same thing, and that was after I had made the post, the story sounds a little bogus, but hey, weirder things have happened, yup the auction did end early and I wonder why, perhaps he was given a side offer he couldn't refuse, maybe it was a bogus auction, anything is possible, all I know is either someone was pulling a lot of peoples legs in that auction or someone just made a nice chunk of change :-) You gotta love free enterprise !

1594. looking for info on 6502 to 65816 upgrade

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-07 00:00:00 UTC
From: Vkoslak <vkoslak@my-deja.com>
Message-ID: <8a41t5$e48$1@nnrp1.deja.com>
Source record: 46155

What all is involved with this upgrade?
are there any compatibility issues other than
things just run too damn fast?
what is the fastest 6502 based chip i can use on
an atari 600xl or 800xl?
the 65816 is apparantly available from
old appleII gs and super nintendos,
should i just get one o these from a flea
market and part it?

Would it be possible to get some kind of
extension to the gtia? id like at least a 320x240
graphics mode with 256 color support. :)

Ive had and used my atari for years, but ive just
recently gotten interested in modifying it.

Id like to work on the 600xl just because i use my 800xl,
so some kind of memory upgrade will be in order too.

Once I get one of my ataris fixed up to run real fast,
id like to program some fun software to take advantage of
my upgrades. so being compatible with some kind of programming
language would be neccesary. whether thats basic, c++ or
assembler. any particular one of these better suited for what
im trying to do? I used to program in atari basic alot, but its
been years. I program mostly in perl now.

Ive seen a few bits n peices on different upgrades, but nothing
yet on the cpu upgrade. please share links if ya got em!

Thanks!

Source record: 46157

I have pretty much the same problem. My XF551 drive would not sync with ProSys from the get-go. So I borrowed a friend's 1050. This worked just fine for a limited time, but now will not work at all. I tried cleaning the head, but that didn't help. The drive is lubricated and looks very clean inside. I don't know what else to do.

Carolyn

You have to find one of the following kits; Dataque, FTE, or a 65802 chip.
> what is the fastest 6502 based chip i can use on
> an atari 600xl or 800xl?
1.79 mHz.
> the 65816 is apparantly available from

> should i just get one o these from a flea
> market and part it?
Not pin compatible with the 6502. so no sense in getting one. If you find a
65802, you can can plug that into an older 800 processor board.
>
> Would it be possible to get some kind of
> extension to the gtia? id like at least a 320x240
> graphics mode with 256 color support. :)
Bob Wooley did a graphics upgade, 2nd GTIA chip. Kind of involved, but
~doubles the amount of screen ram<?> and adds several new modes.
>

IMO: Find some 44256 chips or their equivalent and upgrade the 600xl to 64k
for a starter.
>

Action! is one of the favorites, but you may have trouble finding a cart.

A lot of us have other little nicities to make the system just a bit faster,
things like new OS roms that have fast floating point routines.

IMO: If you do end up downloading some things like Pascal from the
archive.umich.edu you will want to build some flavor of SIO2PC cable to get
it to your 8 bit.

Andrew,

No, never seen the cart and never seen it checked on anyone's list. Suspect it doesn't exist. I have seen evidence of another Parker Bros. title for the 8-bit,however, "Mr. Do!". At least two people had it marked on their list. Also saw one go up briefly on eBay before being pulled. Unfortunately, I have lost the picture from that one.

1602. Schreiersgr&#65533;n 2K

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-08 00:00:00 UTC
From: inf410@worms.fh-rpl.de
Message-ID: <8a5iu1$9u2$1@swemmel.Fh-Worms.DE>
Source record: 46163

Hi to all,

it is time for Schreiersgr&#65533;n 2K on the 25th of March.

This Atari 8 Bit fair is held in east Germany and shows stuff from the past and
some new developments. The fair is the 5th time in Schreiergsgr&#65533;n and has been
the number two in Germany after the ABBUC JHV in Herten/Germany with up to 75
visitors. We we cover nearly everthing that is still in use for the atari 8 Bit.
Don&#65533;t panik if you see some emulators.

We will show:

Atari 1050, XF351, XF551
Atari 800XL/E
Atari 1010 ...
Atari Touch Tablet, controllers ...
Atari Carts (super cardridges, normal, 400/800 ...)
Sio2PC Software and Hardware.
Games and more fun stuff.
Books like DeRe Atari and more.

And I hope some of the nice developments that enhance the graphics, sounds, ports
and so on for the Atari 8 Bit, that have been in development for so long.

At the show will be a game contest with some nice prices. 16 visitors can play
one on one to the final.

More Informations about the fair:

Schreiergsgr&#65533;n 2000

am 25.03.2000
im Saal &#65533;ber der Dorfgaststt&#65533;tte
in Schreiersgr&#65533;n

Beginn: 10:00 Uhr - f&#65533;r Aussteller 9:00 Uhr

Eintritt 1.- DM

Aussteller bitte rechtzeitig melden bei:
Helmut Weidner
Hauptstra&#65533;e 45
08485 Lengenfeld/Vogtland
Tel.: 037606 2688

oder:
Raimund Altmayer
Tel.: 06501 3678

Email: highland@t-online.de

Please give Schreiersgr&#65533;n a try. We will be pleased to see you and some of our friends from the netherlands there. I try to make a Homepage with some pics and cover the hopefully great new software and Hardware showed there.

Can you tell me where I can obtain the program "ataridsk". I
have tons of downloaded 8-bit software that I want to run on my
XL or XE. Thanks, Chris

i never saw one,also never saw risk,or montazuma's revenge,i never knew
any other dealer that got those titles either.
the next best thing would be to get king tuts tombs on cart:)
thanks,
lance

No, you have to wait for someone to resell one. Dataque has kind of moved on
from the Atari market and FTE is in limbo right now.

Probably nothing $100k wouldn't solve.<grin>

I would guess somewhere around 1/2 through the production of the 800 Atari
started using a 6502C which is not pin compatible with the 6502. You can't
even plug a 65C02 into an 800XL because of this.

I have the Atari 800 Technical Ref Notes which includes the schematics. I
think there is only 2-3 chips that allowed the buss to be shared with ANTIC
that were put on chip for the 6502C. I am not sure if those have to be added
to any mod before you can use a 65C02 or 6502B or 65816.

I live in Silicon Valley and have never seen 65816 stuff in my normal
hangouts like Frys, JDR, Halted, etcetera. You would think with Apple being
headquartered here, we would be lousy with the stuff.

archive.umich.edu under memory upgrades. Not sure if that is the right FTP
address, but I think it is. You have to navigate down to the Atari/8bit
directory. I believe it is under the ST section.
http://www.redshift.com/~cdyson/atari.html

Is really one of the best sites to go to IMO for starting projects to dust
off the soldering iron.

I seriously doubt that 'ataridsk' will write A8 single density disks.
The PC, without a special floppy controller, can't do A8 or any other
single density.

Are you suggesting that my time would be better spent forging former
Atari employee's emails, posting trolls under false names, and
canceling others Usenet posts???

I'll leave that to you and your imaginary "society" as maybe with more
practice, you "guys" will get better at it.

I checked it (ataridsk) out. You can find it probably at umich
or http://www.spudster.org , in the emulators/transfer_utilities directory
file called ataridsk.zip.

A few notes.
Start with a brand new Double density 5.25" disk. (If it doesn't have
the hub ring, 99% is High Density disk).
Format it using ataridsk, format it two or three times if it doesn't work
at first.
You must use a pc formated dbl dens disk. you can't just stick your
A8 dbl dens disk in the pc drive, it won't work.
Good Luck.

I believe the cart you saw pulled from ebay was Mr. Do's Castle (not Mr. Do!). I bugged the eBay seller to put it back up for auction for a long time...he kept saying he was going to put it on eBay again, then he said he was going to put it on Yahoo...I don't know if he *ever* put it up for auction again (I kinda doubt it).

Jerry, this issue died a long time ago, and the party involved said he was wrong and apologized about it. Why do you want to waste everyone's time by re-hashing it? The issue should be brought up again only if there is some evidence that the practice has not ceased. Move on with your life.

Hello,
just send me an E-Mail (magea000@mail.uni-mainz.de) and I will return
this program for you. Before I do that you should know: the program is
freeware, it merely works with DOS based PC`s (not with any Windows or
Linux/Unix machines) and finally it needs a 5,25" PC drive capable of
DD/180kbyte (and thus a DD-drive with your Atari to read it). Ataridsk
is only a filecopier-program, you cannot copy any Atari bootdisks with
it (if you transfer ATR, XFD or other images with it you have to extract
them then on your little Atari...)

Hello,
just wait for the appearance of Mathy van Nisselroy`s 1MB Ramdisk. It
has a whole new concept, its fully XE compatible but allows 1MB to be
present with or without Basic, Selftest, Missile Command (XEGS). Yes,
you can have 1MB Ramdisk with Basic or Selftest or Missile Command still
present !! At the moment the RD works fine with XE and XEGS computers,
there will be XL versions avaiable soon... greetings - Andreas

Hello,
maybe, but I think they merely appear to be buggy. The ATR images have a
16 byte header and as you might guess, there are different ATR versions
(with different headers) flying around. Not every emulator can read all
these different ATR versions... greetings,
Andreas

Not a problem with a XF351 (upgraded) drive. Just take a HD disk, format
it to dd/720k. when trying to read it on your XF use a write protect tab
right over the HD hole. Now the XF will read this disk without problems.
If you have a DD drive inside your 3,5" XF even the HD hole won`t matter
(since a DD drive does not detect it !).
But alas, in many cases it is drive dependent, if you can read DD/HD
disks formatted to DD on a HD drive. My DD drive makes no problems,
others may do... greetings - Andreas

Tip: Use 5,25" write protect tabs for that (if you still have some of them...). Normally they fit perfectly on a 3,5" HD hole,making the drive think the disk is a dd diskette... greets - andreas

>
> nir

Hello,
as far as I have heard, the maximum RD memory should be 16MB (remembering ICD, FTE and others). So far I have seen no-one ever using such a big RD... But it should be possibble...
By the way, the biggest disk density or disk partition is also 16MB, referring to Sparta and MyDOS. Next, I guess the biggest cart memory is 4MB others say even up to 16MB... Conclusion: Lets create a whole new Atari, with 16MB (Ramdisk) memory, 16MB (memory) carts and a harddisk with 16MB partitions... Since the harddisk part is already avaiable, who will do the RD and cart for me ?!?
greetings - Andreas

P.S. Thinking of memory upgrade possibilities on your Atari, you could even get mad. Maybe there is no good use for such big memory upgrades, but just knowing that its possible is great. How about using the parallel Bus, it can attach up to 8 parallel devices. Lets imagine these parallel devices would be 8 memory cards a 16MB (thats 128 MB - Wintel PC dimensions !!). Plus 16 MB Ramdisk plus 16MB memory cartridge... Nothing you will ever use this Atari for (and thus some sort of nonsense) but in theory it sounds fantastic...

Hello James,
equipped with an original XF551 (PAL version) and MyDOS 4.5x you can see and hear, that MyDOS is running faster with double density/180k (without any modification). This merely works with your XF and MyDos in DD/180k, do not know why; but it sounds like MyDos is setting up a sort of highspeed SIO in DD (with your Xf drive). You probably already noticed some highspeed SIO with your Happy or USD drive and a DOS that supports that highspeed. Almost the same thing happens with the XF551 and MyDos in DD, although I do not know why... At first MyDos boots the disk as normal, but then it gets quite faster (but only in DD). Maybe MyDos thinks the XF is an USD drive when using DD... greetings - Andreas Magenheimer

P.S.: This MyDos "fast mode" does not work on the XF, when using DS/DD (360k) or any other density than DD/180k...

Hello,
and if you have a disk drive attached to your XEGS, but no keyboard
avaiable, you have to hold down [select] to boot a disk with Basic and
[select] + [option] to boot a disk without basic... to make things
easier:

cassette boot/no boot: hold [start] /no [start] all Atari 8
basic off/on hold [option]/no [option] all Atari 8
no keyboard/keyboard hold [select]/no [select] only XEGS !!

Some Atari 8-Bit hardware and software enhancements make things even
more complicated than that... greetings - Andreas Magenheimer

Did you know you can email money with PayPal.com?

PayPal.com is a completely free service that lets users send money to anyone with an email address. Use PayPal.com to settle restaurant tabs with colleagues, pay friends for movie tickets, or buy a baseball card at an online auction - all with the click of a mouse! PayPal charges the money to an existing credit card or bank account. It's faster, safer and easier than mailing a personal check.

As soon as you sign up and register your credit card, PayPal will automatically send you $10! I recently signed up for PayPal and got my $10 bonus right away.

Signing up is quick, easy and you can download the money to your bank account at any time. No strings attached. Click on this link to sign up and see for yourself:

https://secure.paypal.com/refer/pal=csjjh%40eiu.edu

REFER YOUR FRIENDS AND EARN UP TO $1,000
After you sign up, you'll get an mail like this to send to friends and family, and PayPal.com will give you $10 for each friend or family member (up to 100) that signs up and registers a credit card. It's that easy!

> you cannot copy any Atari bootdisks with it (if you transfer ATR, XFD or other
>images with it you have to extract them then on your little Atari...)

You definitely need DD as the XFD's are 92160 bytes and will fit on an 88k disk. Sometimes a DCM file will be somewhat compressed to fit on a SD disk for conversion on the A8. If you can get the XFD or ATR to the A8, I have a quick BASIC program with USR calls to make it into a disk.

-Ron

I don't have a solution but I admire the problem.

>snip<

I'd like to see another term program out in cart form. After *>several<*
years, I finally got my hands on the Express Cart, but I haven't gotten
around to firing it up yet. I haven't booted my 800 XL since about '92 8-)
but I still have most of my Atari gear. I have a modified 800 XL that has
576K in it and a 256K MIO.

If I had the desk space, I'd run the XL's video through the WinTV card I
have.

Oh, yeah. Is it just me or is anybody else having problems downloading from
Itay's website. Netscape can't find the files.

This the the model "H" that has a quality, almost prototype-ish
mechanical keyboard.
Subsequent SC-3000 consoles featured the rubber-membrane keyboards.

The SC-3000 is positively COMMON compared to the SC-3000H and this is
considered quite a find. I hope you like it.

It is being offered with original carton
4 ROM cartridges: Basic Level IIIA, Basic Level IIIB, Sinbad Mystery,
Starjacker.
SJ-200 Joystick
SR-1000 Cassette Data Recorder
PSU

For more details you can view it here:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=276330271

I believe I used this program a loooong time ago (1 1/2 years ago) I was able to write 1 file to the disk but then had problems with additional adds. I figured out how to put multiple files on the disk(by an offset value) and succesfully created 7-8 DD disks of stuff I wanted to transfer from the PC->Atari (and vice versa). 6 months later I tried again and had no luck and didnt want to spend the time figuring it out again :(

I used a Pentium 133 with a 5 1/4 floppy from a 486 33 machine. So I was using some older equipment which may be more compatibile with the Atari drive stuff??

>Magenheimer

Howdy folks

It works on the XEGS, not the XE or the XL yet. After these ï¿½$%&&/# Exams
are over, I'll have some time again. There probably will be a small PCB
which would make the upgrade about as difficult as the Newell. But you will
have do desolder the MMU. To go to 4 or 16MB after that would be no problem.
(the extra address used will be 4 bytes over the "old" PIA. 4MB would need
2 bits of this address. 16MB would need 4 bits. That still leaves 4 bits :-)

Since I am not familiar with the cable you mentioned can not off the top
of my head help you.
But, as I now have some free time on my hands will offer this. Send the
Indus and the 1050 without any cables or power supplies to me, and pay
shipping both ways will see what the cable is knocking out and repair
them for you (free) other than shipping. At least this way you and
others will know what is causing the problem and were and perhaps the
cable can be modified to eliminate this problem??

Atari 800XL in good working condition. $25.00 shipping included.
Atari 130XE in good working condition $30.00 Shipping included
Atari 1050 Disk Drive in good working condition $20.00 Shipping included

Atari 850 Interface $25.00 Shipping included.
Indus double density disk drive clean condition $30.00 shipping
included
Atari XF551 Disk drive in good working condition $41.00 shipping
included
Atari P/D software on an IBM readable CD-Disk, has the majority of the
first
Pool Disk and 3 U.S. Club libraries on it price $20.00 shipping included
anywhere
in the world.

I have a couple Atair 1040 STe's in good working condition, one with
color monitor 1 with
Monochrome Monitor open to offers, no software for these but they do
work.
1 ea 720k double sided 3 1/2 inch drive for the ST, with cable built in
power supply.

Above Items come with cables and power supplies. Atari 8-bit items come
with a 30 day
no questions asked gurantee.

The 1010 is the tape deck that had the cable already built into the
unit for the atari 8-bit computer line. slow but works. I may still
have the atari infor for the unit. Will dig it out and post the
commands to type that will allow the computer to load from the deck.
If I remember right it was cload "file name" and csave "file name", but
it has been a fair amount of time since i used my unit with my 800xl.
Hope this helps.

Actually, it isn't. The Atari 410 had the cable built in. The 1010 has two
SIO ports, and you must plug a cable into one of them.

FamilyNet HQ: Telnet:\\209.217.2.202

Regarding the 1010 cassette player... When I got my Atari 400, the first device I would get would be the 1010 cassette recorder, and I have enjoyed it ever since. Of course, I started saving data on the 1050 diskette drive, but the cassette drive continues to be hooked up to my system and used for playing auto cassettes. :)

1660. modems and the UK, any issues?

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-11 00:00:00 UTC
From: jonf <pockets@cix.co.uk>
Message-ID: <8adt2u$lb8$1@plutonium.compulink.co.uk>
Source record: 46121

I have had a look at some of the us sites for atari hardware and I noticed some Atari (own brand for 8-bit machines) Modems were avalible. As these particular ones plug straight into the atari i see little problem, however I thought I'd better ask if there were known issues about these with the UK phone network (other than yes, they are slow, they may need a 240 volt power-pack if they do not take power from the atari)_?

You see i work for an ISP in the UK that has a Unix shell set-up, we call it conferencing, and its all telnet based from the user end. I was considering the possibility of using my Atari for this. Well if I can send/recive mail and news on a brother word processor/glorified typewriter then I'm sure that an Atari 130xe, with a modem and the right termianl prog will cut it as well (there is a disturbing rumour of a sinclair spectrum connecting occationaly to us,! I know of at leat one sinclair QL, a few atari ST/Falcons and one Amiga 500 as well) .

I am considering the Ice-T program as the package as that has the zmodem protocol which I do know works on our system.

but my main concern is of course the modem.

Source record: 46123

Apparently the gun is nothing more the older atari light pen with a trigger mechanisim! so its poor rating proberbly relfects the fact that the others were from conception onwards as light guns, and the atari gun was cobbled from the parts bin to give atari some market share. End result, it works, but not as well as the dedicated light guns

llpwhite@cs.com (LLpwhite) says

>But Top Dos does have a lot of features,
>including hard drive support up to 16 MB.

Has anyone used TopDOS extensively? Just found the v. 1.5 docs on the web;
sounds very powerful even though Memlo is sort of high. Has wildcard for drive
number, merge for copy only files not on destination, update for only files
existing already on destination, display and change memory from DOS prompt,
show load vector addresses on ML files and several ramdisk configurations.

One major ommission - no XIO/CIO commands listing?

-Ron

I don't have a solution but I admire the problem.

If there is someone in the UK who can do this I would be very happy.

1668. Survey: Vintage Computer Collecting

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-11 00:00:00 UTC
From: Earl Evans <retro@retrobits.com>
Message-ID: <38CAF112.6EC1A597@retrobits.com>
Source record: 46129
Cross-posted to: comp.sys.apple2,comp.sys.atari.8bit,comp.sys.cbm,comp.sys.sinclair,alt.c64,comp.sys.amstrad.8bit

Hello everybody,

I've been collecting vintage computers for about a year now, and have decided to put up a web site dedicated to vintage computing. The website is located at:

http://www.retrobits.com

If you collect vintage computers, I'd like to ask for your help in completing a survey. Here are the details:

I'm going to launch the first edition of retrobits.com on March 15th. In that edition, I'd like to include an article about collecting vintage computers. It would be helpful to include a wide variety of people's experiences with collecting - therefore, I'm inviting you to fill out a brief survey about vintage computer collecting. If you have the time and can participate, you'd really help me out, as well as helping out other folks who are interested in collecting (or just getting started).

If you would like to respond, please send the responses directly to me to avoid cluttering the newsgroup (unless you believe others in the newsgroup would be interested in your responses, in which case, go for it!). My e-mail address is:

retro@retrobits.com

Note: I will NOT give out your e-mail addresses to anybody, period, end of discussion. If you'd like to be credited by name for your participation in the survey, let me know and I'll be happy to do it.

Here are the questions:

1: Why do you collect vintage computers?

For instance: nostalgia, programming, historical interest, gaming

2: Where do you collect vintage computers?

For instance: thrift shops, garage sales, eBay, other auction sites

3: What advice would you give someone just starting out collecting?

For instance: what to avoid, how to restore dirty/broken systems

Extra credit: I'd be really interested to hear what computers people collect (e.g., micros or minis, brands, age range)

Thanks in advance for your participation! Look for the first results on March 15th. As more responses come in over time, I'll upgrade the collecting area on the site with the additional details!

(can Ice-T be used to connect to text based www. sites.)
Only if you can connect to a lynx type www server. Most of your
ISPs only have PPP or TC\IP or something and you can't get that
with Ice-T.
There is a way to make a PPP connection with a UNIX shell account,
but most ISPs don't offer that either.

Can some kind soul tell me where I can get game cart images for use with the various atari 800 emulators? (ie - pacman, centipede, missile command, etc)

Yes, I have found and do have versions of all the games released on cart in dos file format. But - I would like the cart versions of the games...ones that will work with the "run cartridge" option in the emulators. (yes, I am too lazy to strip out the header info to make the dos versions run as carts :-)

Much thanks for any help.

What is the going price of ATR-8000?

Considering all it does, I've sold them for $100.00. And worth
it. But I am sure you can find them for $50.00 or less.

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

Atari 8-Bit Computers: Frequently Asked Questions / Michael Current

As part of the new docs for Ape'98 I've written a small
disk image FAQ. It's a bit APE oriented but might be of help to
those working with emulators needing basic info as well.

The URL is:

http://www.nacs.net/~classics/ape/docs/DiskImageFAQ/

Hope you find it helpful.

I have Mydos and it doesn't do highspeed sio with anything, unless I
have the BB connected. The BB has highspeed sio routines built into it
that are used instead of the OS sio routines that MyDos uses

What version do you have?? I have 4.5

Playing around with the emulators....

Okay, this game appears to be similar to Adventure on the 2600. But it seems confusing and glitchy. I can get to white, black and red castles, and have found yellow and green keys. Never found a goblet (grail). Where are the yellow and green castles? If anyone remembers this game well enough to give some guidance I'd appreciate it very much.

If your in the UK that will be cix, they call it conferencing

i am not aware of others that support a shell account, but i would like to
be proved wrong.

I admit i work for CIX in support and i have to explain telnet to brother
word processor users quiet often, it seems they connect the same way.

I know of people who connect atari STs and even a Sinclair QL user, must use
Zmodem though.

any other unix shell accout sytems out there?

prehaps we should pull together a list?

I played this game until my hand hurt and never could win. YOu need to figure out the 'tunnels' inorder to get to the right room(sorry cant remember).

Here's how I won(from a friend way back)

Take the Holy Grenade an ddrop it in the room with the ship and leave. When you come back the screen will be blasted into bits and pieces. See if you can make your way across the screen to the exit on the other side(through the debris field). You will be close to the Grail and should be able to figure it out from there.

I believe the 'tunnels' eventually lead you to the room opposite the ship, but getting a good debris field eliminates that problem :)

1685. Re: modems and the UK, any issues?

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-13 00:00:00 UTC
From: Alan Sharkis <asharkis@erols.com>
Message-ID: <8aip2e$ip7$1@bob.news.rcn.net>
Source record: 46046

When our local library system (Nassau County) offered free Internet service to patrons a few years ago, it came in two flavors. One was graphical and appealed to people with newer PCs and Macs and the other was text-based Unix with Lynx and PINE running at the library's end. I saw that as a possibility for the guys in my 8-bit club and encouraged them to sign up. Many did -- some running as slow as 1200 baud. A similar system in an adjoining county had a year or two more of experience and their service could even be used at 300 baud.

The library's system had 28.8Kbps modems -- not really fast by today's standards -- but the guys were able to take advantage of modems up to 9600 baud the limit of their interfaces (850s and P: R:s) -- not the limit of their modems. If they had Black Boxes or MIOs, they would have been able to go to 19.2 Kbps. Some were using 1200 baud and 2400 baud modems. You'd have to check with the Unix system you have to see if it would accept the generally slower speeds (300 baud or maybe 1200 baud) common in direct-connect modems available for the Atari 8-bit. Ice-T is an appropriate terminal program -- more for its 80-column display and VT-100 emulation than for the Zmodem file-transfer protocol. However, you must understand that there are two flavors of Ice-T. I assume you are using the one that takes advantage of the 130XE's memory.

BTW, the library decided to discontinue the service as of the end of this month for what are essentially fiscal reasons. I guess the next move for the user group members, many of whom have PCs now as well as their Ataris, is to use the PCs for most of their Internet activities. Unix shell accounts provided by ISPs are getting exceedingly rare.

Should you run into a Unix system that won't accept the baud rates you can achieve with your Atari, you may want to consider using a PC as a proxy server for your Atari (Tom Hunt.) The two are connected via a null-modem cable, the PC does the telnet connection and the Atari does the rest.

Shell accounts are becoming very rare. I know of an ISP in the US that offers them, but they are regional. It may not last too long, either.

My library system offered it for a while, but the entire system is shutting down access to home users because they have no money to continue.

Hello fellow Atarians,

I would like to note that I have made a general
Atari Emulation mailinglist dedicated to.....
tada Atari emulation! :)

It's a mailinglist for the emulation of Atari systems
from the Atari 2600VCS to the Atari Jaguar en from the
Atari 400 throught the Atari ST. Even post about emulation
on an Atari is welcome!

Feel free to join by sending an e-mail to:

atari-emul8-subscribe@egroups.com.

Yours,

Niels Wagenaar

I would second XL-it... I believe there's a Windows version, which means it'll run well under Windows 2000 (whether or not that's important to you... for me, the switch to Win2000 means half my emulators are broken because of the lack of sound under DOS emulation).

I never bothered trying any of the other emulators because XL-it seemed pretty much perfect to me.

Message-ID: <38cd6bb0$0$488@wodc7nh0.news.uu.net>
Source record: 46053

Hello all,

I am looking for a registered copy of Daisy Dot III. My copy has been ruined due to moving several times, plus I've lost one of the disks.

I am also looking for a set of disks called The Users Guide to DD3. it's a set of 6 disks or so that has extra fonts, and info on how to use the fonts.. I can't remember the name of the person who wrote it. but he did a very good job. all the disks I try are damaged... even my backups..

So if anyone has some info, to where I can get these again, it would be appreciated!

Thanks.

I'm wishing to find out the names of two games
what were on the two red tapes which I got
bundled with the 65XE here in the UK.

I know the following games were on them:

Cloak of Death
Leaper
Up, Up and Away
Savage Pond
Missle Command
Asteroids
Star Raiders
Centipede

The ones I REALLY want to find the names of are:

The "Super Cobra"-style game
The adventure set on a spaceship

Any response would be great.

1694. ASPI interface for Black Box

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-13 00:00:00 UTC
From: Belitz <Matthias.Belitz@gmx.de>
Message-ID: <01bf8d43$9feb81c0$93f24ec2@lrata2>
Source record: 46055

```
ASPI for XL/XE computers idea 03.14.2000 by Matthis Belitz

"Atari (Advanced) SCSI Programming Interface"

What is this good for ?
There are a few number of SCSI interfaces for the XL/XE computers out now,
f.e. BlackBox, MIO ... and the ATAPI devices for the IDE-interface are
accessed by a similar commandsets.
At the moment every developer has to write his own drivers for basic access
along with any tool that could be useful for his interface. F.e. thats the
reason, why only one interface ( I know) supports CD-ROM access at the
moment even at least two further interfaces have the hardware interface to
do so.

So a better solution it would be to split the tools in abstract high level
drivers and hardware specific low level drivers with a well documented
software interface.
A developer of a new IDE or SCSI interface only has to write the low level
drivers and so could use all of the already existing tools.

Here are some examples for such high level drivers or tools:

- ISO 9660 FS driver to have read access to common CD-ROM
- MS-DOS FS for access of Dos HD / medias (f.e. Zip 100)
- CD-player Tool
- even scanner tool may be possible

As SCSI devices are blockdevices, a reuse of the SIO-control interface
would be a nice idea. I suggest the following implementation.

DDEVIC $70 for ASPI manager
DUNIT $01 ..(number of ASPI manager, could be more than one f.e. SCSI,
IDE)
DCOMND $XX ..(command code)
DSTATS $ ..before execution data direction $80 write, $40 read, after
execution error code
DBUFR ADR ..databuffer
DTIMO ..timeout value
DBYTE ..expected number of bytes to transfer
DAUX ..adress of the SRB (SCSI request block)

command codes

$00 host adapter inquiry
$01 get device type
$02 execute SCSI command
$03 abort SCSI command
```

$04 RESET SCSI device
$05 set host adapter parameters
$06 get disk drive information

SRB
byte TID target id
byte CMDLEN command length (number of bytes follow, 6, 10, 12 byte SCSI commands possible)
6-12 bytes SCSI command

The main goal should be to include the ASPI routines in device ROM, so that tools with any DOS could use it.

I have already started the development of an ASPI manager for the Black Box, one the msc IDE-interface will follow.
I would really like to have this an open source project under GNU-license.

I am waiting for your suggestions.

Matt

roadmap ASPI manager

- execute simple commands (INQUIRY) -> done
- basic read data subroutines -> done
- handling status requests of target -> done
- handling message requests of target -> done for one byte messages
- handling more data expected than could be transfered -> done
- handling less data expected than should be transfered
- handling wrong data direction expected
- basic write data subroutines
- set up manager which could execute ASPI commands as described (at the moment only "execute command")
- rebuild manager for BB-ROM patch
- additional burst read subroutines
- additional burst write subroutines
- rewrite code for speed improvements

roadmap tools

- Audio CD-Player -> very basic player done
- ISO 9660 FS

Nostalgia, and to test how games should load and what models
they work on.

>
> 2: Where do you collect vintage computers?
>
> For instance: thrift shops, garage sales, eBay, other auction sites

Car Boot Fairs, and one from ebay, but ebay is generally a rip off.

>
> 3: What advice would you give someone just starting out collecting?
>
> For instance: what to avoid, how to restore dirty/broken systems

Get yerself to your local car boots and pay between ï¿½5-ï¿½10 for any
speccy stuff. You won't know if the item works until you get it home
and in my expreience they are usually broken in some way or another.
Even though the sellers will tell you they work, beware.
Start at a low price and barter them. Stay at your accepted limit.

For ï¿½6 I got the following items:
1 x Huge box of games
1 x Big plastic bag containing 6 josticks and interfaces
1 x Currah uspeech
2 x ZX Spectrum 48k+s, one has dodgy keyboard membrane but can be
replaced ;-), the motherboards have different
issue numbers.
1 x Tape Recorder.

A real good find that day.

> Extra credit: I'd be really interested to hear what computers people
> collect (e.g., micros or minis, brands, age range)

I collect only Spectrum stuff. I already own the following machines:
2 x ZX Spectrum 48k+ (different issues)
1 x ZX Spectrum 128k +2 (Grey)
1 x ZX Spectrum 128k +2a (Black, has printer port)

1 x ZX Spectrum 128k +3 (Disk drive is broken and a new one didn't fix
it either ;-()

I've just won a bid on ebay for a rubber key 48k speccy. For ï¿½26
(gulp), but I've
been after one for a while, and it comes with a printer ;-)
I saw a pristine conditioned rubber job at a car boot sale for ï¿½15
including
a sh1t load of stuff. I wish I bought it now, but never mind.

I still require a 128k original speccy, but I refuse to pay the amount
they go for
on ebay. I'm actually not bothered about the packaging, so it should be
cheaper.

Problem is that from where I live if I venture closer to London, a boot sale is somewhere where you can get your head kicked in for free and further west and the only boot sales I might find consist of high falootin types flogging old barber jackets out of the back of their Range Rovers. Bah!

Dont mess with XFormer. It doesnt run most games/applications and has a crappy interface to boot. Sound also sucks on it.

Atari800Win has been the best emulator for my use. Runs most apps/games, is fast and sound is very well done. There is also Atari800Dos if you have a slower machine.

Just my $0.02

>
>JP

Hmmm, check the FAQ Michael Current posts. It should be inthere.

Or better yet try this:

Go to: www.atari-computer.de\abbuc

It's in German but that doesn't have to be a problem.

From there you can do two things:

a) go to the site of the FloppyDOC (via one of the buttons. The one with the flames is the right one). And look for "Best Electronics". This get you to the site of Best Electronics. Best Electronics is in San Jose, California.

b) Click: ANZEIGE or INSERAT (I'm not sure what they named it)
This will get you to the small ads. Many have Email addresses. Most younger people in Europe speak English. Atleast enough to sell you their stuff. I'm not sure how much the Mark is against the Pound, but it's approximately 3 Marks to the pound I guess.

CU Mathy van Nisselroy

PS if you can afford it, get Best's Catalog. It's a must have for all Atari owners 8 bit as well as 16 and 32 bit.

Howdy John

>can any one recommend a method of upgrading my 130XE to 320 or above.
>If there is someone in the UK who can do this I would be very happy.

I'm devellopping a memory upgrade that will have 1MB, separate CPU and ANTIC banking, no loss of software control over BASIC, SELFTEST, OSRAM or Missile Command (MC on the XEGS only).

It works on my XEGS, but I have not found time to get it to work on other machines. After I can get it to work on regular XE's and the XL, some PCB's will be made.

BTW I still use the standard Atari address to control extended memory.

Two reasons1) because I used to have one
2) because I never owned that one

There were a lot of computers that I would have liked to have owned but could not afford the ridiculous price tag. Now I have the cash and the price is ridiculously low. 8-)

> 2: Where do you collect vintage computers?
>
> For instance: thrift shops, garage sales, eBay, other auction sites

Car boots, jumble sales, junk shops or in one case sitting on top of a TV waiting for the bin men.

> 3: What advice would you give someone just starting out collecting?
>
> For instance: what to avoid, how to restore dirty/broken systems

If you cannot see it working do not take the seller's word for it.Get a soldering iron and cheap multimeter and get ready to get your hands dirty.
If you are going to salvage old computers you will come across dirty contacts all the time. Most computers which lie about for a while develop oxidation on the terminals and it interferes with plug in bits (I have had this on sega master, speccy, zx81, nes). Clean them off and they will be like new.
A completely dead (ie no signs of any life at all) computer is normally a power supply fault. Check the transformer O/P first as the leads get internal breaks near the connectors (most external PSU computers I have used develop this especially the ones which have to be set up and put away after use). Next check for internal fuses (CBM +4) and broken power connectors (speccy and Atom) and even damaged PSU connectors lifting off the tracks (zx81).
That should solve most of the simple systems faults. Anything else will probably require more serious knowledge.
I have rescued a couple of 'completely dead' machines from the dump box beneath the car boot tables which only required a replaced fuse or a replaced power plug :-)

Hello, hope someone can help me with this:-

I bought a load of carts at a boot sale, one of which was a
Parker Bors. cart with a small white typed sticker saying "ATARI
400 POPEYE 16k RLS.1" or something to that effect. Can anyone
tell me about it...maybe why it has this little sticker instead
of a real label? Could it have been a magazine review copy or
something?

Any help/guesses welcome to:-

kwd1mpo@bolton.ac.uk

thanks!

kevin

From: Curt Vendel <cvendel@worldnet.att.net>
Message-ID: <38CE8308.B9C094AE@worldnet.att.net>
Source record: 46070

Hi everyone,

I just recently bought out an entire office of from N. California which had been used by Atari from 1980-1984, well the shipment arrived and after sorting through some of the items there are duplicates of various items which I am going to sell, I don't see a need to have to own 2,3 or more of the same item so I am offering one of the first duplicates for sale to the first buyer, no Ebay stuff, this is a straight sale:

Atari 1200 pilot run (prototype)
smooth untextured case
marking labels ontop of function key area
pilot run motherboard inside

$300 for first taker.

CONDITIONS!!! Ok, to make this fair for EVERYONE, I will take the first offer at 8PM Eastern time TOMORROW: 3/15/2000 night, this gives everyone enough time to see this post, all offers before tomorrows time will be ignored, I will reply to the first offer with a reply cc'd in the newsgroup. The buyer has 5 days to make payment, plus shipping or the second offer will get the unit.

As I sort through the duplicated of hardware, software and paperwork I will start to make all duplicates available for sale (no auctions) here in the newsgroup.

1716. FS: Internal Atari solder masks for 850

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-14 00:00:00 UTC
From: Curt Vendel <cvendel@worldnet.att.net>
Message-ID: <38CE8922.759742DF@worldnet.att.net>
Source record: 46077

This is a set of the original solder masks used to create the Atari 850
interface motherboards. Soldermasks are negative sheets of flim
measuring 10" x 12" and each sheet (set of 5) contains the various masks
for each layer of components, silkscreening, drilling holes and so
forth. I have one duplicate set which I am making available on a
first come first buy basis, if you are a true Atari computer collector
then here is your chance to own a set of Atari internal use solder mask
films.

$150 to first buyer

1718. Re: Atari 400 popeye cart

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-14 00:00:00 UTC
From: ejgnandt@my-deja.com
Message-ID: <8amfkoekh1@nnrp1.deja.com>
Source record: 46079

Release 1 of a test program? Sounds like a prototype. Its easy to
fake a prototype, however. (Take off the label and write something else
on the cart.) Unless the game is different from the released version,
how would one know? Its one reason I don't collect protoypes. A
prototype of an unreleased game would be interesting, however.
I saw someone spent $200 for a "prototype" of Bezerk on eBay. Its
available at B&C for $14.95. Didn't have the heart to tell them.
Caveat Emptor,
Gene

Sorry everyone, the 1200XL keyboards sold like hotcakes, I still have a few more 800 keyboards and plenty of the 400 membrane keyboard (I doubt those will be flying out the door too quick! :-)

The cartridge lot is sold, sorry.

Curt

1723. FS: Atari CX-70 Lightpen

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-14 00:00:00 UTC
From: Curt Vendel <cvendel@worldnet.att.net>
Message-ID: <38CEBE3A.A4298F58@worldnet.att.net>
Source record: 46084

I have only one spare of these, the Atari CX-70 Lightpen is the original thick beige light pen originally designed for the Atari 400/800 computers in 1981. These are among the rarest of items as only a small run of them was ever made and are NOT the same as the later CX-75 slim black lightpens sold by Atari in 1983.

First offer of $100 gets it.

>>joystick,Joypads SUCK).
>>A big THANKS to Emmanuel.
>
>Tell us more about it.
>Is it "plug and play", can the joystick still be use with a PC?

Yes, please please tell me more - the original message is no longer available on my ISP. Where can I get this adapter? I've been looking for a way to use an Atari joystick on my PC for the past year or more, but haven't found one. (for the Mac, there's an adapter made by Kernel that works great, but I can't find a similar device on the PC). HELP!

1726. Re: joystick port

Newsgroup: comp.sys.atari.8bit

From: Russg <russg@en.com>
Message-ID: <38cf02c0$0$40289@news.erinet.com>
Source record: 46087

```
(where to read joystick ports)
PORTA- 54016 decimal, $D300 hex.
I not expert here.
I think a 255 means both joysticks (on xl/xe) are in neutral position.
Bits 0 to 3 are joyport 1 bits, something like this (from Mapping the Atari)
forward - bit 0,4 = 0
backward- bit 1,5=0
left- bit 2,6=0
right- bit 3,7=0

That'd be bits 0 to 3 for joyport 1 and 4 to 7 for joyport 2.
This assumes you have an xl/xe, where PORTB isn't used for joysticks 3 & 4.

For Sale:

SWP ATR8000 interface box. Gives your Atari 8-bit 1 serial modem interface, 1 buffered parallel printer interface and 1 standard floppy disk interface (I've used everything from standard 5.25" disk drives to 8" disk drives, you can even open an Atari SF354 disk drive, unplug the ribbon cable and plug a long ribbon cable from the inside of the disk drive to the ATR8000 and use 3.5" disk drives as well!)
The unit has 64K of memory and comes with the CP/M supplement manual.

$50

Curt

1732. Atari 800 w/The Integrator & Corvus

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-15 00:00:00 UTC
From: Curt Vendel <cvendel@worldnet.att.net>
Message-ID: <38CFADFB.A6DD79CA@worldnet.att.net>
Source record: 45997

For Sale:

An Atari 800 with THE INTEGRATOR Personality OS board installed. For those not familiar with this board, it was designed by David & Sandy Small back in 1981 for use in the Atari 800. It replaces the standard Atari OS with an enhanced version that allows the Atari 800 to use Corvus hard disk systems. By holding down the Option key during power up, a menu is displayed which allows you to configure the Integrator to not only use a Corvus hard disk system, but to also BOOT from the Corvus, no disk drives needed!!! You can also have it set up RAMdisks and boot from them as well. Once configured the Integrator is transparent and you use your newly enhanced system like normal... only a lot faster and more convenient.

Included with the Atari 800 w/Integrator is a Corvus to Atari Interface. This box connects to the Atari 800 controller ports 3&4 and then connects to either a Multiplexer (for allowing up to 64 Atari 800's to network to a single Corvus HD) or directly to the Corvus HD. You will also get a Corvus HD chasis with power supply and HD interface. The Hard drive has been removed, you will need to purchase a standard MFM 5MB or 10MB hard disk (seen on Ebay all the time, also I see Corvus HD's on Ebay all the time) for the unit.

Before the Integrator was released you had to use a specially modified version of Atari DOS 2.0d (yup, d) to format the Corvus HD, now with the Integrator installed you can use almost any Atari DOS with the Corvus HD.

Atari 800
Integrator OS card
64K Ram card
Corvus-Atari Interface module
Corvus HD System (no HD installed)

The whole setup together is: $500 plus shipping.

Curt

1733. Re: Atari 800 w/The Integrator & Corvus

Message-ID: <38CFB5B2.25AE3827@worldnet.att.net>
Source record: 45998

For anyone interested in buying this setup and looking for a Corvus HD, there is one on Ebay right now and it also has a built Corvus "Mirror" system which allows you to backup your Corvus to a VCR tape, I will make a copy of the Mirror software for anyone who purchases the below system and needs the Mirror software.

> C/ I�igo Arista 14 - 6C
> C.P. 31007 Pamplona (NAVARRA)
> ESPA�A
>
> PASO No. 2:
>
> Ahora elimine el #1 de la lista de arriba y mueva los otros nombres un
> n�mero para arriba (el #6 se convierte en #5, el #5 se convierte en #4,
> Etc.) y agregue SU NOMBRE y direcci�n como el #6 en la lista.
>
> PASO No. 3:
>
> Cambie todo lo que crea conveniente de este art�culo, pero trate de
> mantenerlo lo mas posible cercano al original. Ahora ponga su art�culo
> en por lo menos 200 newsgroups(existen mas de 24,000 grupos). Solo
> necesita 200, pero cuando mas cantidad lo ponga, mas dinero le
> llegar�!!!.
> Aqu� van algunas indicaciones de como introducirse en los newsgroups:
>
>
> ----------
> COMO MANEJAR LOS NEWSGROUPS
> ----------
> No.1 Ud. no necesita redactar de nuevo toda esta carta para hacer
> la suya propia. Solamente ponga su cursor al comienzo de esta carta,
> haga click y lo deja presionando y b�jelo hasta el final de la carta y
> l�rguelo.
> Toda la carta deber� estar sombreado. Entonces, apunte y haga click en
> edit arriba de su pantalla, aqu� seleccione copy. Esto har� que todala
> carta quede en la memoria de su computadora.
> No.2 Abra un archivo notepad y lleve al cursor arriba de la p�gina
> en blanco. Presione edit y del menu seleccione paste. Ahora tendr�
> esta carta en el notepad y podr� agregar su nombre y direcci�n en el
> lugar #6 siguiendo las instrucciones de mas arriba.

> No.3 Grave esta carta en su nuevo archivo del notepad como
> un .txt file. Y cada vez que quiera cambiar algo ya lo puede hacer.
>
> ---
> PARA LOS QUE MANEJAN NETSCAPE
> ---
> No.4 Dentro del programa Netscape, vaya a la ventana
> titulada :Window y seleccione netscapeNews. Entonces elija del menu
> Options, seleccione Show all Newsgroups. En segundos una lista de
> todos los Newsgroups de su server aparecer�. Haga click en cualquier
> newsgroup.
> De este newsgroup haga click debajo de TO NEWS, el cual deberia estar
> arriba, en el extremo izquierdo de la p�gina de newsgroups. Esto le
> llevar� a la caja de mensajes.
> No.5 Llene este espacio. Este ser� el t�tulo que ver�n todos
> cuando recorran por la lista de un grupo en particular.
> No.6 Marque el contenido completo del .txt file y copie usando
> la misma t�cnica anterior. Regrese al Newsgroup TO NEWS y Ud. esta
> creando y empastando esta carta dentro de su programa o posting.
> No.7 Presione send que est� en la parte superior izquierda.
> Y UD. HA FINALIZADO CON SU PRIMERO!...CONGRATULACIONES!!! .
>
> ---
> LOS QUE USAN INTERNET EXPLORER
> ---
> PASO No. 4: Vaya al Newsgroups y seleccione Post an Article.
> PASO No. 5: Carge el art�culo.PASO No. 6: Repita el No.6 mas arriba.
> PASO No. 7: Presione el bot�n Post.
> ---
>
> ESTO ES TODO!. Todo lo que tiene que hacer es meterse en diferentes
> Newsgroups y empastarlos, cuando ya tenga pr�ctica, solo le tomar� unos
> 30 segundos por cada newsgroup!
> **RECUERDE, CUANTOS MAS NEWSGROUPS CONSIGA, MAS RESPUESTAS (Y DINERO)
> RECIBIRA!! PERO DEBE DE ENTRAR EN POR LO MENOS 200**
> YA ESTA!!!.... Ud. estar� recibiendo dinero de todo el mundo, de lugares
> que ni conoce y en unos pocos d�as!. Eventualmente querr� rentar un
> P.O.Box por la cantidad de sobres que ir� recibiendo. Si prefiere usar
> sobrenombres, puede crear un nombre toda vez que el cartero entrege
> donde debe.
> **ASEGURESE DE QUE TODAS LAS DIRECCIONES ESTEN CORRECTAS
> Ahora el POR QUE de todo esto:
> Tomemos un ejemplo:
> * De 200 enviados, digamos que recibo solo 5 respuestas (baj�simo
> ejemplo). Entonces hice $5.00 con mi nombre en la posici�n #6 de esta
> carta.
> * Ahora, cada uno de las 5 personas que ya me enviaron los $1.00 tambi�n
> hacen un m�nimo 200 newsgroups, cada uno con mi nombre en el #5 de la
> lista y solo responden 5 personas a cada uno de los 5 originales, esto

> hace $25.00 mas que yo recibo,
> * ahora estas 25 personas pone un m�nimo de 200 Newsgroups con mi nombre
> en el #4 y solo se recibe 5 respuesta de cada uno. Estar�a haciendo
> otros $125.00 adicionales.
> * Ahora esta 125 personas ponen sus m�nimo de 200 grupos con mi nombre
> en el #3 y solo recibe 5 respuestas cada una, yo recibo un adicional de
> 625.00!.
> * OK, aqu� esta la parte mas divertida, cada una de estas 625 personas
> ponen sus cartas en otros 200 grupos con mi nombre en el #2 y cada una
> recibe solo 5 respuestas, esto hace que yo reciba $3,125.00!!!.
> *Estas 3,125 personas enviar�n este mensaje a un m�nimo de 200
> Newsgroups con mi nombre en el #1 y si solo 5 personas responden de los
> 200 grupos, estar� recibiendo $15,625.00!!.
> De una inversion original de $6.00!! mas estampillas(sellos). FABULOSO!
> Y como dije antes, que solo 5 personas respondan muy poca, el promedio
> real seria 20 o 30 personas!. Asi que pongamos estos n�meros m�s a
> calcular.
>
> Si solo 15 personas responden, esto hace:
> en la #6 $15.00
> en la #5 $225.00
> en la #4 $3,375.00
> en la #3 $50,625.00
> en la #2 $759,375.00
> en la #1 $11,390,625.00 (imaginate)
> .....si, mas de ONCE MILLONES DE DOLARES!!!
>
> Una vez que su nombre ya no esta en la lista, saque el ultimo anuncio
> del Newsgroup y envie otros $6.00 a los nombres en esa lista, poniendo
> su nombre en el #6 y repetir todo el proceso. Y empezar a ponerlos en
> los Newsgroups otra vez.
> Lo que debe recordar es que miles de personas mas, en todo el mundo, se
> conectan al Internet cada d�a y leer�n estos art�culos todos los d�as
> como USTED Y YO LO HACEMOS!!!.
> As� que creo nadie tendr�a problemas en invertir $6.00 y ver si
> realmente esto funciona. Algunas personas llegan a pensar...y si nadie
> decide contestarme?
> Que!! Cu�l es la chance de que esto pas� cuando hay miles y miles de
> personas honestas (que como nosotros) buscan una manera de tener
> independencia financiera y pagar cuentas!!!., y estas dispuestas a
> tratar, pu�s No hay peor lucha de la que no se hace. Se estima que

(Talk of an 'Express' cart.)
I am a little wondering here.
Keith Ledbetter did all the express stuff, 850 Express, 1040 Express.
The term programs.
They were free-ware, no registration or anything.
The BBS Express was sold to Bob Klass, and then went to the
speaker here, Lance Ringquist at Video 61. I'm not talking about
BBS Express (Pro or regular).
I think we're talking about the 850 Express, which I never knew was
sold to anyone, underground Mike Hohman or anybody.
Could Lance fill us in on the path to present ownership of 850 Express?
I would think Keith Ledbetter still holds the rights to it, and he isn't
underground.
ie. When did Mike Hohman buy the rights to the 850/1040 Express
term programs?

(followup to followup on 'Express' carts, who owns Express programs, etc.)
I meant 1030 Express, not 1040 Express.
They were freeware, but I'm sure Keith Ledbetter might want to know
about a commercial venture putting those on carts, I guess.
Refresh my memory. Wasn't BBS Express (regular) put in public domain
by either Bob Klass or Keith Ledbetter?
Perhaps 850 Express was also put in public domain, in which case
no permission would be needed to put it on a cart and sell it, maybe.

>Russg" russg@en.com says:

>PORTA- 54016 decimal, $D300 hex.
>I not expert here.

54016 is the hardware register for stick number 1 and 2. The OS separates them
and keeps status in RAM locations 632, 633, 634, & 635 where it calls them
STICK0, -1, -2, -3. Bits zero to three are used for each port as Russ desribed.
value meaning
------- -------------
15 neutral
14 up
13 down
11 left
7 right
10 up&left
6 up&right
9 down&left
5 down&right
You can see how it works with a 1 line program; RUN this and play with the
stick.
10 PRINT PEEK(632): GOTO 10

-Ron

I don't have a solution but I admire the problem.

Hi Nir,
I just got my zip connected to my new BB just about three weeks ago now, so I'm probably the resident newbie around here.
Here's the basics for an external scsi zip drive:
1. You need a parity pal chip added to your BB. CSS will do it for you, just give 'em a call.
2. You need an adapter to connect 50-pin flat ribbon cable header to a 25 pin SCSI port on the back of the zip. I pressed a 50 pin centronics scsi header onto the ribbon cable and a plugged a centronics-to-25-pin adapter into that. Its kind of goofy, but I had these parts laying around, and it works fine.
3. Termination should be selected to ON if its the last drive on the chain.
4. To save the settings of the BB, you need a SCSI device having id #0. All the external zips I've seen won't do this, so I added a SyQuest Ezflyer removable drive which can be set to id #0 (Syquest went chapter 11 recently and you can get these drives for almost nothing). This works really well because the BB can save different sets of partition tables to each removeable cartridge you have. You can also do partition to partition backups with CSS's HD Backup Pro software. I've heard from others that an internal zip can be set to id #0, so you probably don't need a second drive if you plan to go with the internal model.
Overall I couldn't be happier now with my 130XE & BB. It is astounding how fast the I/O is out of the BB. Most applications and games load practically instantaneously.
here's some pictures of my setup if you are interested:

Thats sounds like what im looking for,
but what about buttons?
the sega controller i have has a b c and start buttons.
The lines on the joystick port are all connected, so something
must be getting a signal. would this be putting different
values into the strig?

Thanks!

Possible solution?

I have found that when a later drive as a 1050, Indus, Percom ect, can not read a disk that has flakey sectors, the disk can in fact be read by a 810 Disk Drive. If this is so then it is possible to read the disk in an 810 and transfer it to another drive.

It would cost more to populate them than they are worth. Best
Electronics sold a kit with the board years ago but populating the board
was more expensive than buying a unit complete. Not to rain on anyoun's
parade but just stating facts.

I've also found that the 'scratchy' disks that have degraded
and basically sound like they have sand in them can be recovered as
well. Just remove the disk from its sleeve, wipe it off with a damp
cloth, put it into a sleeve from a new disk, and they usually read OK.

I've used this method to recover disks that were TOTALLY unreadable
and would even mess up every drive they were put into because of all
the magnetic gunk in the old sleeve.

I'm consistantly amazed at how durable disks written in Atari
disk drives are. With my PC I feel lucky if a HD disk survives a week.

(about joyport use.)
Lemme see. Mapping the Atari (Ian Chadwick).
Like RHamilton said, 632-634 stick values, already mentioned, shadow
of $D300, $D301 ($D301 just for 800, not xl/xe).
644 and 645 are for STRIG0 and STRIG1, shadow for $D010, $D011.
PTRIG0-1 use same $D300 as joystick bit 2 for ptrig 0 bit 3 for ptrig 1.
(PTRIG is paddle trigger).

Ha ha ha ha ha.
I bought one of those 850 boards. When an 850 cost like $108, the board was I dunno maybe $10.
I thought I'd go to Radio Shack and get the stuff to populate it with.
It was a neat enough printed circuit board.
I really don't know what I thought. Maybe I thought it was a poplulated board without the case or something.

The hardware addresses for the standard Atari joystick buttons is 53264 for stick 1 and 53265 for stick 2. It's just a one bit input for each stick. Additional buttons might use the paddle inputs, or maybe a simultaneous 'left' and 'right' or 'up' and 'down'.

I am pretty sure that the drive itself can see the 1.44 punch in the disk and sets up the drive electronics for 1.44 density. Formatting the disk in this mode at 720K will not produce a reliable copy. In the old, old days, when these first came out, lots of guys just punched the 720K disks and made them into 1.44s..... Unlike the 5 1/4 disks, I don't believe that the 1.44 disks are formulated differently than the 720s - just the changes in the electronic characteristics of the drive allows the 1.44 to work. I think..... I'll have to fool around with this a little.

Cross-posted to: comp.sys.apple2,comp.sys.atari.8bit,comp.sys.cbm,comp.sys.sinclair,alt.c64,comp.sys.amstrad.8bit

Hi everybody,

Just wanted to let you know that the retrocomputing web site I've been working on,

http://www.retrobits.com

went live, as scheduled, yesterday evening!

Thanks to those of you who helped out with the collecting survey. And for those who haven't filled it out but are still interested in doing so, there is still time. There was so much material, I broke the article into three parts to do it justice. Parts II and III are yet to be written, and if any new points emerge on Part I, I'll update that section also.

The site's premiere contents include:

- Vintage Computer Collecting, Part I
- An Interview with Cameron Kaiser
- Book Review: "Apple - The Inside Story of Intrigue, Egomania, and Business Blunders"

and of course, Cameron's world-famous Commodore and Tomy web sites!

Please visit the site and let me know what you think. And bear in mind, it's my goal to make the site increasingly interactive over time. I want nothing more than to make this a useful, community-driven retrocomputing resource. If you've got ideas for information, articles, and other resources you'd like to see, please pass them along.

And if you've got any questions or concerns, please don't hesitate to contact me.

Thanks,

Earl Evans

Sounds very different, coincidental name perhaps?
The 'ataridsk' that I have is by Charles Marslett with NO German prompts...?
What is the source of yours? If it works, can you send it?

-Ron

I don't have a solution but I admire the problem.

1762. FOR SALE: Complete Atari 1200XL APE system with dedicated APE PC

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-16 00:00:00 UTC
From: Sydtech <REMOVENOSPAM_sydtech@sydtech.com>
Message-ID: <sd2ojvjm9n139@news.supernews.com>
Source record: 45944
Cross-posted to: comp.sys.atari.8bit,mn.forsale

I'm moving and have decided to sell my Atari 8-bit setup. It is:

- An Atari 1200XL modified with Steve Tucker's outstanding APE WARP+ OS upgrade...
- An IBM PS/2 Model 75 red plasma-screen "luggable" computer with 12 megs of RAM and 240mb hard drive loaded with my registered copy of APE w/Prosystem as well as megs of Atari 8-bit stuff
- A working 3COM Ethernet card installed in the PS/2 system - the DOS redirector is installed - connect to your LAN and/or the Internet.
- An SIO2PC cable
- Two 1050 drives, all the necessary cables and power supplies, etc
- A Commodore 1702 color monitor

Check out http://sydtech.com/atari8/ for pictures and info and make an offer.

Please mind the spamblock if replying via email! Thanks!

Scott

> ->Dan

Update on Carolyn's cable. As I posted to the newsgroup, I wanted to check out the non functional cable she had and she graciously sent it to me via mail.

Turns out the PIN 5/Green<?> of the Atari SIO cable she used was bad. After a few girations of looking at what could be wrong with the thing, I finally checked for continuity and sure enough, broken contact.

I've now used it to make 4-6 .atr images and haven't had any trouble yet.

I did have to search a bit to find a good disk to use. Leaving things in a wet basement for ~7 years didn't help things much. The oxide looks like it is blooming and has a tendancy to just wipe off. Lucky I found a good disk that was left in one of my 1050s in the attic.

I would like to change the contruction of the thing now to be on the safe side. Instead of using the zener to drop voltage by 5.1, it would be better to just solder it, band end to pin 14 and other end to pin 7. Solder PC 9 pin connector pin #7 directly to the 14C89 pin 14.

This should work marginally with a non CMOS 1489 if that is all you have available.

I'd also bet the trouble with Carolyn's XF551 could be the standard broken contact SIO problem they all suffer from.

1765. FREE Atari Computer Catalogs! Also on Web site and FTP!

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-
Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at
http://www.atari.benjamin.net And Jump to my FTP site linked to my Web
Site so you can Download Free Catalogs or FTP directly to my site at:
ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way,
Feel free to Request catalogs through E-Mail. Really, it's not an
inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both!
Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail.
Please let me know if I can attach text files to your E-Mail. Catalogs
are just regular ASCII text files so you can download them into your
text editor and view them, edit them or print them out! It would make
things easier for me if you take my Catalogs, load them into your text
editor, delete what you don't want and E-Mail me the rest! To expedite
things, include your complete Mailing address so I can figure your
Shipping/Postage & Handling. I'll be back after the weekend.

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. So checkout what's new on
my WebSite. In Fact, check it regularly as my Catalogs are updated
regularly. Customer's are served, first come, first serve! I have 6
different Catalogs, and my SoftWare Catalogs are my largest. They have
the biggest Byte Count. You should see my inventory! I have TruckLoads
of HardWare, Boxes & Boxes of Software & Libraries of Books & Reference
Material for the Classic Atari 8 Bit & Atari ST! And remember, if you
can't come see me today, come see me tomorrow!

1768. Re: ATARI 1450XLD COMPUTER

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-16 00:00:00 UTC
From: Curt Vendel <cvendel@worldnet.att.net>
Message-ID: <38D075C8.A8ECB974@worldnet.att.net>
Source record: 46023

Hi Bob,

According to engineering logs and production records and a conversation with Atari's production line manager there were 75 1450XLD cases made, 250 1450XL motherboards (short boards with PBI headers for the disk drive daughter cards) were made, 25 "TONG" 1450XLD motherboards with everything built onto 1 single motherboard were made at Atari WONG and shipped to Sunnyvale. A small handful of 1450XL disk drive controllers were made, all were hand made wire wraps, nothing production line ready. Most of the 1450XL motherboards found their way into 1400XL cases, very few 1400XL's have actual motherboards that say 1400XL on them. The 1400XL was slated to be cancelled and never publicly sold within Atari. In late 1984 a new low cost XLD was going to be released called the 800XLD, it would be an 800XL with freddie chip and disk drive controller, no modem or speech synthesiser, target price: $350, not to shabby since the 1050's themselves at the time were selling for $359!

Curt

> Cut the bottom edge, the edge near the oval opening?

I used a single edge razor to slice a slot along the top edge of
the disk, right at the top of the curve where it folds over. Do it
right and the disk can be slid right out. Same goes for the new disk.

The first few times I just ripped the sleeves open along the
back folds where they had been spot sealed. Made for a messy looking
thing that was hard to get into a drive, but worked well enough to
make a good clean backup of the recovered disk.

Hello,
the Atari LG is indeed very similar to a Lightpen (how should it operate
then ?!?), but it is a little more accurate than the Lightpen. Whenever
I use the Lightpen with LG games its about 2-3cm away from its actual
point, the Lightgun is more accurate...
Next, the Lightgun seems to have an "inverted" Lightpen fire-button (or
trigger). Use the Lightpen on games like Crossbow and others and you now
have Machinegun-fire (also known as Auto-Fire)...
greetings - Andreas Magenheimer

Hello,
1) if you tag/select a file with the RETURN key Ataridsk immediately
copies this one file; 2) to do a copy of multiple files use the SPACE
key to tag/select more files, then go to the very end of files, where
you find the german word "kopieren". Once there press RETURN and all
tagged/selected files will be copied (if the diskspace is big enough,
otherwise you get an error). greetings - Andreas Magenheimer

check the collectibles page, its $7.95
http://www.myatari.com/bccollec.txt

They've got all kinds of dorky stuff there like atari belt buckles,
patches, and solar calculators

Another really neat item that b&c computervisions still carries is the
blue canvas dust cover for the 130XE. It has a large white Atari logo
on the front and fits perfectly over the 130XE. I ordered mine at the
same time I got my coffee cup.

No. This is a "digital" signal, it's either on or off. However,
the remaining buttons could use the "paddle" input lines, try to
read these. PADDLE(0) and PADDLE(1) from Atari Basic, IIRC.

So long,

Here's an update:

I tried cleaning the heads as James B. suggested and that got the two 1050s working again. The Indus, however, still doesn't work. It might be that my Indus just died, but I'm still weary that the cable might be the culprit somehow.

Bob, I appreciate your gracious offer. If you're interested, I will send you my Indus, my original PROSYS cable, and the schematics I used to build it. And of course I will pay shipping both ways. Do you need a power supply as well?

Thanks to all for the help!

While we're on the subject, some people have asked me how to flatten a disk that was creased in the mail.

You can take it out of its envelope, put it between two sheets of glass, and put the assembly in the sun for a few hours.

<< 4.21 is the last version I know of. >>

4.22, dated 11/5/95 was the last version that I know of for SDX. If I recall it's the version with the sio driver to allow SDX and the MUX to work together

As far as having the rom image, I seem to recall that SDX required a custom PAL in its supercart. While I'm sure the emulator writers could work around this, anyone just wanting to burn a rom might be out of luck

burning a new rom is the easy part. I received my latest one direct
from mike and burnt it my self. works great. The PAL however would be
a bit of a problem.

Hi!

In article <20000316173210.01552.00002206@ng-cb1.aol.com>, RHamiIton5 wrote:
>Sounds very different, coincidental name perhaps?

Yes, that's correct. I have written the program some 6 or 7 years ago
and thought 'ataridsk' was the perfect name for it. About 1 or 2 years
later I found out that there was already a program named 'ataridsk'
at the umich-archive, but I never renamed it...

>What is the source of yours? If it works, can you send it?

You can download it from http://www.horus.com/~hias/atari/
The current version is V1.2 from December 1995, including an
english user interface and documentation. If you don't have
access to the web, I can mail it to you.

HTH,

XF551s are kind of nice, but not too smart. I haven't had one in a long time, but IIRC they don't do things like determine density when you first insert a disk. Did you try doing some things like cycling the power off/on to see if it would come up in a good density?

Just another bit of drift, I left clone/Prosys cable/810 hooked up overnight. Still working this morning after about ~16 hour burn in.

simultaneous 'left'
> and 'right' or 'up' and 'down'.

Paddle buttons use "left" and "right" on the joystick pins. In theory
you can actually play a game of Dave's Midnight Magic just using the
paddles (just like in the pic from the Apple version). Problem is that
you can't launch the ball since you have no "down" :(

(Which was why I took the circuit out of a used joysick and used that
for playing pinball. :)

Oh boy...another round of Hasbro bashing begins again :)

Serious though, it looks like a nice game. But I was expecting
something like that to be like Arkanoid and not a Pong sequal. Maybe
for the remake of Super Breakout perhaps? ;)

Still waiting for that ultra cool remake of Galaga...

Heh- I was blown away by this:

The December 27 entry mentioned David Bohlke. Turns out he also wrote a
couple of BASIC compilers in addition to his games. One was commercial,
and one was a type-in program for ANALOG Computing (a magazine I'm guilty
of mentioning frequently). The latter was a great hack. David came up with
a minimal subset of Atari BASIC that his compiler would accept, and then
he turned each of these constructs into the obvious machine code. He only
allowed statements like "X = Y + constant," GOTO, and one or two IF
statements. It's probably the only BASIC compiler to be written in a
couple of pages of BASIC.

I wonder what you could write in that minimalistic language? I loved my
Atari and its rather rich BASIC, but never got into the ML level...
Anyone hear more about this?

Source record: 45968

Hi to all...

I have noticed a number of official-looking Pac-Man variants and was wondering if anyone has any info on them. They are all copyright dated 1982 by Atari. The first is my trusty cart that I use on my 800XL. It doesn't have any startup screen other than the "Press Option..." screen. The other two I found on the Web. One of them has the "Character/Nickname" startup screen, and the other starts up like my cart but has the intermission animations during the game (which my cart doesn't have). Are these disk versions? Revised carts?

Just curious...

Thanks.

1810. Want to transfer old Atari 8-bit disks to PC in Ft. Lauderdale, FL: will pay $

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-18 00:00:00 UTC
From: Jeffrey Glen Jackson <jeff@jeff-jackson.com>
Message-ID: <38d39698_1@news.uncensored-news.com>
Source record: 45971

I don't have a working 800XL anymore (don't know why it doesn't
work) and can't find the power supply for the IndusGT disk drive,
so can't try connecting it to the PC with www.emulators.com cable.

Do you have the necessary hardware and software to copy single
and double density Atari disks to the PC? Do you live within
a couple of hours of Fort Lauderdale FL? Do you want to make
some money? I'll gladly pay you to help be copy a couple dozen
disks to the PC.

Send me email at jeff@jeff-jackson.com. Thanks.

- SCSI monitor (lets you perform some SCSI commands and displays the
buffer) -> basic version done

There are some basic tools yet, but I would label them "ALPHA" .
But if someone is really interested in assisting me, please mail. You will
get some additional information, the lastest versions ...
The task you have to do is to test the tools and send me your results.

Matt

As your newsgroups selection includes csa8, would you please explicitly refer to "the coin-op Arkanoid", as the Atari version sucked big time (there was a type-in version called "Unicum" in the German "Happy Computer" magazine that was much better).

There is a difference between the "Express Term program" ie 850 Express
and the "Express Cart".....the Express cart, is owned by FTe I
belive....it is a Sparta X/ICD type Super cart....it works well and is
integrated with Express Pro BBS.....there is an Express term cmd which is
also integrated with the Express Pro BBS which was worked on by Stephen
Carden.....it is part of the BBS program....

So let's summarize

850 Express (Shareware?) disk program
Express Cart (owned by FTe)?? Super cart
Express Term Command (owned by Express BBS Pro owners)

Hi Ryan,
I keep all the cords and power supplies in the XT case... It gets a little warm in there at times, and I'm considering installing a small fan in the back... probably try to get to that next weekend (I also need to replace the battery in my R-Time8!!)

I have a large bookshelf for all my atari books to the left, and behind is a huge steel cabinet for all my original software boxes, manuals, and disk organizers. All my carts are kept in the small wooden chest on the desk in the picture. This setup is also located in a room of the house called "my office" where no kids are allowed (at least yet... my wife & I have two twin baby boys and one toddler!) and its basically just devoted to Atari hardware. I have this 8-bit setup, and a 4MB STE & an ICD hard disk, and also a Jaguar. Oh, and an Apple IIe with a mockingboard... I like to hear the music in Ultima IV when I play.

I suppose things will get more messy when I begin my next project. See the Armatron there? I'm planning to go ahead with the "Arm your Atari" project from ANALOG magazine in next few months.

Take care,
Dan

I remember that issue, I was fascinated by it at the time. I didn't
do anything with it myself but it would be neat to hear if any others
did.

It's probably not what you meant, but most type in BASIC compilers and
interpreters were published in BASIC source code. Most of these
were BASIC loaders though, that just read a ML program from a lot
of DATA statements and wrote it to disk as an executable. The
German magazine Happy Computer even had a type in BASIC interpreter
and compiler for the XL that was fully compatible with Atari's
own BASIC interpreter but a lot faster.

Still I wonder if anything could be done with that. At first it seems
like a clever entry into Assembly, but then at second thought to do
anything you would probably have to know a lot of addresses.

> It's probably not what you meant, but most type in BASIC compilers and

yeah, I remember the Antic entry program, which had some very cool
checksumming features. That BASIC you talk about sounds pretty cool. I
probably should've got into "Action" or some of those others "better than
BASICs" but the only other language I played with was there very god
implementation of Logo, with 4 turtles that looked like turtles... it also
had a very neat Daemon event model, so I would program the 4 turtles to
walk around the screen, turning when they bumped into the boundary of a
circle theu were in, or each other, or when the fire button was pressed.

I wonder if my programming life would've been different if I got into
Assembly on the Atari 800XL or C=64. I tried on the latter, but didn't
have a good reference, and the course-in-a-book I had was really awful.
Over all maybe I would've been better off with an Apple, at least in the
low level hacking sense.

To respond to this message, please use the enclosed link rather than your reply button.

Updated as of 03/19/00

I have a limited amount of brand new Atari Jaguar items for sale or trade. These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping.

If you are interested in any of these items, please respond to me by using this automated link jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (all contain one controller, RF Box and AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $50
- Atari Jaguar with CyberMorph cartridge $40
- Atari Jaguar (No Cart) $30

** Atari Jaguar Accessories - New**
==========
- Jaguar unit alone (No power supply, controller or accessories) $20
- Composite Video Cable $15
- Spare Controller $15
- AC Power Supply $15
- RF Switch Box $10

** Atari Jaguar Games - New/Shrink-wrapped**
==========
- Checkered Flag $10
- CyberMorph $5 (No Box)

Atari Force Comics Please make an offer
==========
All are in Mint Condition
- Issue #2 - February 84

- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for rare or shrink-wrapped/sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- A working SONY SAT-A50 DSS Satellite Receiver
- Working DSS H or HU Cards
- And of course the ever popular, original Intellivision keyboard (should I be so lucky :).

Stick the floppy in bottom side up on the XF551 drive. You can read
and side two without any problem. You just cannot format side 2
without cutting an extra timing hole in the disk jacket. I am
assuming a single sided format on the disk.
Mike Toelle

1825. Re: Reading SIDE B with the XF551

1826. Pooldisk $5 version with over 5000 ATR files still available

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-19 00:00:00 UTC
From: ernest@wxs.nl
Message-ID: <38d5469e.1365932@news.wxs.nl>
Source record: 45987

Several months ago, I wrote a spindle of cheap CDR's with the Pooldisk Too. This is our double CD with over 5000 ATR files with mostly public domain software, shareware, freeware and various utilitites and lots of other stuff. Pictures, commercials in computer movie format etc. etc. Stuff for use with SIO2PC and/or APE, or for the various emulators that are available.
These are the cheapest available CDR's, we do not put a label on them, there is no jewel case, and thus no inlay either. Since we ship these CD's without a jewel case, all risk of them getting damaged during transportation is yours. We will ship the double CD to you for US $5. This is the cheapest we can make it. We will ship the CD's at the lowest possible rate. If you want the CD's sent by priority mail, add one more dollar. We have about 10 sets left, so we hope to sell them all, since we calculated the price based on selling all of them. If you have any questions, or if you want to know how to order these CD's, feel free to E-mail me.

Keep those XL's/XE's humming.
Ernest.

Try $750, that's what the last one sold for on eBay from some guy who gave himself positive feedback.

But that's eBay where cost and common sense are not obstacles to buying anything.

Not sure if it's the same one you're talking about, but the last one I saw on ebay was at $735 when the auction ended early. The "seller" is no longer an ebay user. Make of that what you will.

With the 360k drive on the floppy board, it all depends on the mech it
self. Some look for the index hole before they will read disks. The
idea being, you cannot put in a disk upside down .

Yes thats the same one Jeff (memory failure on bid price). Check the guy's feedback and guess which one he wrote himself. I was burned on eBay once in a similar way when some seller had gave himself a number of positive feedback messages and had no intention of sending the item. This one looks very similar. Wonder if the guy paid and received is XLD.

Steve,

Bruce has sold all kinds of Atari knick knack type of stuff for many years
(belt buckles, stadium seats, coffee mugs, lapel pins, etc). He even has these
octagonal labels that were intended to be put on the top of 2600 joysticks that
Atari decided not to use.

Breeze through his on-line catalog. And also, get a copy of the Best Electronics
catalog.
There are all kinds of stuff to order from them also. Here's some examples:

- Sew on patches (round and mini fuji's)
- Inflatable red Atari bird kite
- Brass plated Atari belt buckle
- Brass plated Atari fuji belt buckle
- a variety of calculators (small pocket to small desktop ten-key types with
printers)
- Atari balsa wood "Atari Power Without the Price, Flying High" plane/glider
- Atari XE demo cartridge (Joust, Ms Pacman, One on One, Flight Sim II)
- Atari Service, Factory Authorized white pocket protector
- 2600 stand alone service center joystick, paddle, power supply test unit
- Posters (Stargate, Dig Dug, Alien vs Predator, Iron Soldier)
- Children T-shirts from a Alfie the Alpha-Bits (kids cereal) promotion
- Kasumi Ninja head band
- Atari flying high "airline style" plastic wings
- Jaguar hologram stickers
- Atari player on board window sign (remember Baby on Board)
- Silicon wafer's with Atari custom IC's on wafer

That's about what I saw listed in the catalog for sale. Catalog has been out for a
couple years,
so he may be out of some of the stuff.

You're absolutely correct on that one! When ICD made the SDX carts, the
PAL chip they used has a security fuse so that the burn code can't be read.

Back in July of 1997, I briefly talked with Tom Harker about the PAL chip.
He said that he would burn new ones for people who needed their carts fixed.
Unfortunately, with the way ICD is today, I think he would take the persons
money and not produce!!!

Let's just hope the PAL chips on our carts never die. Or were shit out of luck
until someone can reverse engineer one.

> Could you briefly explain what a PAL is/does? Are these "read" and "burned"
> with appropriate equipment in similar fashion to a Eprom?

PAL stands for Programmable Array Logic. You are correct in that they are burned
in similar fashion as to EPROMS. But most do not have erase capability. Some do.

What they are is a chip designed to consolidate several to many TTL IC's down into a single
convenient package. Circuit board space and IC's can be costly when producing large
quanties. Engineers would get bonuses for every chip they would eliminate from a circuit
board. Steve Jobs did this for Atari. He got about a $1000 dollars for every chip
he eliminated from the game Breakout (arcade version). I can't remember how much he
got though.

A designer would work out his logic design using boolean algebra. And then using a compiler,
convert this logic into a burn pattern. All circuit logic can be broken down to simple AIR (AND,
OR, INVERT) logic. That's the logic that you find on most PAL chips. And they come in quite
a wide variety depending on your design.

PAL chips would contain gates like AND, OR, FLIP/FLOPS, Exclusive OR's, etc. And a lot of
them also contain what are called security fuses. These prevent someone from reading back
the burn pattern and helps the designer protect their design from copying. Most EPROM burners
don't program them. You either have to buy a special made burner for PAL/PLD devices or buy
the high end ($1000 and above) programmers that do EPROMS, PALs, microcontrollers, etc.

PAL's are neat devices to work with. I haven't produced any circuit's of mine own with them yet,

but I'm learning about them.

Hope this answered your question.

Howdy Glenn, folks

>Let's just hope the PAL chips on our carts never die. Or were shit out of luck until someone can reverse engineer one.

It's probably used to decode some addresses. With the help of John K.Picken's file on cartridge control and a look at the PCB inside the cart this doesn't have to be a problem. Please don't offer this job to me. I don't have SDX.

CU Mathy van Nisselroy

PS Diamond GOS uses a PAL too.

This is a boxed, unused, NEW Atari XC12 program recorder for use with the XE, 400, 600 and 800 lines (it matches the XE color scheme...so park it next to your XEGS and enjoy the view!). The unit is unmarked. The original wire twist is still in place on the cable, and the protective plastic film is still on the front name plate. The poystyrene inserts are bright white and unmarked. The manual is unmarked other than being slightly creased where it was folded to go into the box. The box looks great too!
Please email me your money offer at mbowlin1@tampabay.rr.com

Actually, the ABC (Monarch Data) basic compiler is written in basic as
well. Even though, it's not a true Basic to ML compiler. It generates
p-code which is linked to a minimal interpreter system (~4K).

So long,
Thomas

1845. Re: Reading SIDE B with the XF551

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-20 00:00:00 UTC
From: "John K. Picken" <yg473@victoria.tc.ca>
Message-ID: <Pine.GSO.3.95.iB1.0.1000320092733.18493A-100000@vtn1>
Source record: 45857

IIRC you can read and write to side B, as Mathy put it: "Just like you would on a 1050." but, you can't format side B.

1846. SID Upgrade for Ataris!

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-20 00:00:00 UTC
From: David Lloyd <dmlloyd@atari-central.com>
Message-ID: <Pine.LNX.4.10.10003201138050.5955-100000@saruman.ws.inxpress.net>
Source record: 45858

Alright, my evil designs for the unholy marriage of Commodore SID to Atari computers is complete!

Unfortunately, to prototype my design I need a PAL programmer. Does anyone know a place to get a simple, cheap programmer that can do 16R4 and 16R8? I only see them for $300-400 or more, and that's *way* out of my budget... got a baby coming you know!

Anyways, here's the features:

- Up to 8 SIDs supported. They run at 1.0000MHz, very close to a C64!

- Uses the PBI in 600/800XLs and the ECI in the 130XE.

- Sits at D1xx. I may make this switch-selectable if there are already lots of projects at this address!

- Potential for adding in a stereo mixer device. Does anyone know a good 8-input stereo mixer chip? :-)

- Expansion header for adding 16 potentiometers (in case the 4 that Atari gives you aren't enough!), 8 external audio inputs, and the 8 audio outputs. (This is where you'd add in that mixer device I mentioned! :-)

If I can get those PALs burned, I'll whip up a prototype and write some software for music synthesis. I will start working on a nice drafted schematic to put up on my website (www.atari-central.com), along with PAL pin descriptions so that everyone can build one! :-) Also, I may look into prices on mass-printing PCBs for the project, so that if someone wants to build one, they don't have to go through wire-wrapping heck!

Also, if anyone else has any interest in this project, or any suggestions or ideas for add-ons, let me know!

One last note: Very special thanks to Bob Wooley for explaining to me the best method for getting two different clock rates to synch up! I used his idea pretty much verbatim. ;-)

I think I remember an option on the Monarch compiler where you could select pcode or native ML output. (At least one of the Atari basic compilers had it, if not the ABC). It was the first reference I recall saw for pcode. But, I don't remember the actual tradeoffs a given program would experience under it...

From: Richard Cortese <ricortes@netmagic.net>
Message-ID: <sdct4djelul15@corp.supernews.com>
Source record: 45861

I have now left Carolyn's fixed cable running the entire weekend ~3 days straight. Still haven't seen a problem with it and used it to make a few more copies this morning.
I think I will hang it up on the burn test, doesn't seem to be a problem when used with 1050 or 810. I don't have another type of drive to test it with right now, but if I come across and Indus or XF551 I will buy it.

1850. Re: list of Basic commands?

Newsgroup: comp.sys.atari.8bit

Source record: 45862

(Wants Atari BASIC reserve word commands and syntax.)
I'll plug B&C Computer Visions. I looked at Bill Kendrick's newbie/emulator FAQ and it has some Atari BASIC commands.
http://www.sonic.net/nbs/new_and_emu.html

But, I'd really suggest Lon Poole, McNiff and Cook, 'Your Atari Computer'.

There are some pretty good vendors in the Vendor/Developer list (see the comp.sys.atari.8bit FAQ in http://www.faqs.org under comp under comp.sys.atari.8bit.

www.myatari.com/bc800hw.txt look down the price list there.
for $12.95 plus probably $5 ship, you can get that book.

Ben Smith may also have it or Best Electronics, but I didn't check those.

You may want to use Lattice ispLSI chips for prototyping your idea. But you have to build a little adator, if you want to use PAL in the real environment later. The software you can get for free at latticesemi, the smallest chips (2032) are around DM 14,- ($7) here, the cable for the serial download you cand build by yourself for less than $5 I think. There should be a scematic out, if not, asked me.

Matt

P.S.: Maybe someone will write a software to enable the download of the JEDEC via JoyPort of the Atari. As I remeber, all specs for the download format are out ...

>> How can I read Side 2 of a standard 5 1/4" floppy that was created with the 1050 drive on
the XF511 drive, or a 360k drive connected to the Floppy board!?<<

No problem with the 551, unless the 551 is
stock and has to switch density. The format
issue has been covered pretty well, except
for potential fixes for the 551. As far as the
Floppy Board, generally there is no problem at all. I have used both Chinon and Tandon
mechs. with my FB, and they have no problems reading >> or formatting << the
back side of a regular (non-flippy) disk.
Evidently Bob designed the FB to take the
timing from something other than the index
hole. However, I'm reasonably sure that you
could find some mechs that would ill-behave
with this setup.

In general, p-code compilation makes your object smaller but slower than a
straight-up machine language compile (there are some pathological situations
where it can be *bigger* and slower but these aren't common).

Some compiler systems also allowed you to spit out a common P-code object that
could be run on any system supporting that particular set of pseudo-opcodes.
UCSD Pascal was one of these. And, of course, the modern descendent of that
idea is Java. I don't know of any BASIC compiler that does that, unfortunately.

1858. 800 Working Again!! Thanks guys!

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-20 00:00:00 UTC
From: Mark Milbourne <milbourn@usit.net>
Message-ID: <38D6DF60.A9B89947@usit.net>
Source record: 45870

YAY! My 800 is working again!

A quick word of public thanks to the newgroup. My 800 and 1050 stopped talking to each other a while back. I thought the 1050 was bad and posted about it and several people took time to help out and we eventually determined that the 1050 was probably OK but that the 800 was failing to pull the COMMAND line low when trying to talk to the 1050, so the just 1050 wasn't paying attention.

Once we got that far, another post and subsequent replies helped me determine that the culprit was a bad PIA (6520) chip in the 800. I just got the replacement today - stuck it in and she booted right up. So we're back in business! Now I can finish the last 50 levels of Lode Runner. :-)

Special thanks to Steve Tucker and Lee Barnes who not only both took the time to respond initially but then followed through with a number of subsequent e-mails as we narrowed down the diagnosis. Everyone else had good suggestions about possible causes of the problem and at the least I could know what the problem was not, or have ammo to help troubleshoot future problems.

My hat is off to all of you!
Long live the classic Atari!

8Bitfan wrote...
I was the high bidder for this item when the auction ended. During the
early part of the auction I received a E-Mail from the seller inquiring
if I was able to pay for the item. I replied that I was able.

I was actually on the site (a Sunday) thinking that the auction was to end
on Monday. Much to my surprise, the auction suddenly ended. Thinking that
I had screwed up the ending date, I sent the "seller" an E-Mail to attempt
to
complete the sale--nothing back from "seller". I repeated the (required)
attempt to contact the "seller" on Monday, Tuesday and Wednesday---
nothing. So on Thursday I sent a VERY polite reminder to the "seller"
about E-Bays policy concerning contact after an auction.

What I received back was a very nasty note saying " I didn't know who
I was dealing with and don"t lecture me on E-Bay policy" The "seller"
also stated that he had pulled the item because he had just fount out
that 1450XLD had voice capability which did not work on this machine.
He said he intended to re-list the item at a later time.

Earlier, I had contacted Curt Vendel of the Atari Historical society
to ask some question regarding the number of these units that were
ever made. In his reply, Curt stated that he had attempted to contact
the "seller" and was also rebuffed. Of course, I didn't sent any money
since the "seller" stated that he had ended the auction and had not in
fact "won" the auction.

Sorry for the long post but I just wanted all to know the details...

1864. list of Basic commands?

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-20 00:00:00 UTC
From: Gary Beckwith <gavrael@att.net>
Message-ID: <38D5A215.2A4B3A82@att.net>
Source record: 45992

Anyone know where I can view/download a list of Atari Basic commands? I dug up my old Atari 800 for my son, and remarkably the games still work. I wanted to show him how to use Basic and I still remember some of the commands but sometimes I get stuck and if I just had a list of commands with basic syntax I might turn my kid into a programmer!

Thanks,
Gary

There is a legit 4.22 rom out there as well. I believe MH
sold a few before doing his magic act.

As I recall one of the computer emulators can use the SDX
rom image, which means they figured out the 512k bankswitch scheme.

With that info in hand it should be possible to produce a new
set of pal equations that do the same thing in hardware...

don't forget the express cart. The reason the express and diamond PAL
won't drive the sdx rom is because all three have there rom switching
addresses different. That way, you can put all three together and they
"should" work.

I have a mech that if a disk is put in upside down, will spin all the
time but it will read the disk. Another one I have will not work at
all if the disk is upside down.

>it, if not the ABC).

Not as far as I know of. The ABC I know just produces plain p-code. In fact,
it more or less translates every basic instruction into a sequence of
elementary p-codes, resolving algebraic expressions, i.e. an

A = B + C

ended up by a P code like

Push A, Push C, Add, Store C

It didn't even try to optimize some obvious cases, even a "Graphics 2+16" ended
up in two "push" codes, plus one add, plus one "graphics".

The "TurboBasic" compiler, though, compiled to true ML, but required a larger
runtime library which wasn't linked to the executable (hence, the executables
weren't "stand alone" applications, and larger in general.)

So long,
Thomas

I have the MMG compiler, I think the disk has gone south by now though.

I liked its approach to compiling basic. Each line was converted to a label
such that all GOTO, GOSUB etcetera were converted to JSR LL10 or JSR LL205.

The runtime library was fairly small too, only something like 4k. They
offered both INT and FP libraries and you could chose between them. RT was
automatically appended with the program at compile time. I can't remember
where it loaded, but I seem to recall it was somewhere well above $2000 as I
compiled a few 80 column terminal programs with it and never had someone say
their R handler stepped on it.

1883. RF to AV adapters???

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-21 00:00:00 UTC
From: The Keith <mrkeith@prodigy.net>
Message-ID: <8b9hc5$7t28$1@newssvr03-int.news.prodigy.com>
Source record: 45894

Hey, I recently found my Sears Telegames sytem and I was wondering if there was anything I could do to convert the old RCA-type RF signal on the console into a S-VHS (supervideo) AV signal. I don't care about getting S-video quality or stereo sound (I realize that I wont be getting that) but I just need the connections to be S-video and standard RCA audio (mono or stereo) because I have this switchbox that I use with all my video components and since my other components are s-video, this must be s-video also. Any help would be appreciated. Thanks

1884. Re: RF to AV adapters???

I dont hink you could turn RF into S-video, the two fundamentally
different.

RF is, quite literally, RADIO FREQUENCY, and video, well, 30FPS - do I
need to do on?...

To convert your games system to S-video, you need to get back to the
source of the video (on the games machine, that is) and output a more
'senisible' singal, does it have a digital or analog raw output (like c64,
atari, VIC20, etc)????

hope that helps.
chris.

<< don't forget the express cart. The reason the express and diamond PAL won't drive the sdx rom is because all three have there rom switching addresses different. >>

I don't have an Express cart to play with, while I know that the Diamond piggyback cart will drive most standard Atari carts, I'd be interested to see what would happen with another supercart stacked on top. I'm not sure of the address range Express uses to switch in and out it's programs and overlays, but I'm guessing it's operation is similar to that of the Diamond GOS cart. Pokes to the D5xx range switch between the different banks, and I seem to recall reading back in the old GEnie days that the cart also held a commonly used 4k window of routines in place. My question would be, do both carts try to hold the same fixed 4k address space? I ask this because DataQue used to market a supercart that held a 4k window in-place while switching in and out a program window space. You'd write your common logic to the 4k window and then DataQue's cart could be made to bank select windows in rom's up to one meg.

The SDX cart seems to do this as well, holding a 4K window for use of carts common logic, command.com and Sparta.sys (and maybe others) to switch in and out of (located outside cart B address range if I recall though I may be mistaken), a fixed 8K window for the SDX library routines, and an 8k window to switch in and out the SDX programs (arc, menu, etc.) and overlays.

I only wish I'd saved all the old chat logs I'd had with the likes of Crag Thom, Keith Ledbetter and Alan Reeve.

1886. Re: SDX ROMs Wanted

Newsgroup: comp.sys.atari.8bit

Source record: 45897

<< Actually, someone mentioned 4.22. >>

4.22 was the last rom update that MH put together, I believe with the help of Jeff Williams (Alfcrunc).

The only real addition is an SIO driver that allows SDX to work with the MUX carts. I recall Mike saying at the time that he was going to try for a Y2K fix for the TD driver but sadly, that never happened.

I've got to say though, I'd love to have seen the relocatable compiler for SDX programs (betting it was a custom cross compiler written for an MSDos box) and the developer doc's for the SDX library routines.

Ahh bet it's all lost to history now .....

Allan,
Hi there, I see you are curious Black Boxes. We have a member down here who has two. I have been curious to try to get the thing working, and maybe in the future we will. The gent who has it has something like a two hour video taping on how to get the black box to work. Would be fun to try in the future.
Good luck with your box,
Doctor Clu

Hi all,
Recently got a XEGS which has been cleaned up after it sat in a junk store for a year. Turned out to be a nice system. The system did nicely as a game unit next to my Jaguar in the front room, but for a time I thought I would try to use it as a actual computer (give my Franken400 a rest for a bit). So far so good. The detachable keyboard is a nice touch, though I wish the cable were longer. Any methods out there to extend it... oh, about twenty feet? (grin) (I like to kick back and read the newsgroups on the Atari8 from across the room. Normally use a joystick.) Anyone up to the task of being hired to make a cable that long for the XEGS? :)

Do you have any serial device, like the 850 interface or the R:? A null modem connection from that point (and a telelink cartridge if you are lacking a disk drive) would be simple enough from there. .

1892. PhillyClassic East Coast Classic Gamers Event Apr 14-16

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-22 00:00:00 UTC
From: David Newman <davidnewman@adelphia.net>
Message-ID: <38D8A643.C8E78C0D@adelphia.net>
Source record: 45903
Cross-posted to: comp.sys.atari.8bit,comp.sys.amiga.games,rec.games.video.nintendo,rec.games.video.sega

Hi everyone:

I know that *some* of you know about this event already, but I just wanted to give everyone an update (or an introduction, as the case may be) to what is shaping up to be a terrific event coming up April 14-16, 2000. If you have any questions, please feel free to email me. Or if you have some cool classic gaming items you'd like to bring and do a session on (even just an informal show'n'tell kind of thing), we'd love to have your participation. Or bring your goodies for sale or trade. Or just come, play, browse, shop, and meet some fellow gamers and collectors.

** PhillyClassic, Philadelphia's first annual Classic Gamers' Event! **

FEATURED GAME PLATFORMS include:
ATARI 2600 5200 * 7800 * 400/800/XL/XE COMPUTERS * C64 * AMIGA * COLECOVISION * INTELLIVISION * VECTREX * DREAMCAST * PSX * JAGUAR * SEGA * NES * plus a few surprises!

** UPDATE: 3.21.2000 **
A little more than 3 weeks to go! People are coming from all up and down the east coast - NY, CT, PA, NJ, DE, MD, even Canada! Join the fun! Get those ticket orders in SOON. We have about 14-16 tablespaces left as of today. We also have a number of dealers coming, so there will definitely be a cornucopia of classic gaming goods available for sale and trade.

Many sponsors and friends added. These folks are either coming to the event, sending a door prize or tournament prize, or BOTH! For full details, see:

http://members.aol.com/davidn9000/philly.html

Here's a sampling of what you'll have a shot at winning as either door prizes or tournament prizes:

* 3 Missile Commands for PSX (donated by Hasbro)
* 3 Space Invaders for N64, GBC, and PSX (donated by Activision)
* Asteroids for PSX (donated by Activision)
* Intellivision Collection for PSX (donated by Activision)
* 6 NEW revision of Ed. 5 Digital Press Guides (donated by Joe Santulli of Digital Press)
* 3 copies of Leonard Herman's book "PHOENIX: The Fall and Rise of Video Games"
* Verrrry cool AdventureVision logo T-shirts donated by Jeff Folejewski of AdventureVision.com

AND MORE STILL TO COME!

Website has complete details, including
* Information/scheduled events
* Hotel accomodation info/online reservations
* Door to Door driving directions and interactive maps
* Ticket information
* How To Link to Us banners/ads available for YOUR classic game related site!

http://members.aol.com/davidn9000/philly.html

** UPDATE: 1.31.2000 **
TNT Amusements, a local coin-op vendor is allowing us to borrow a Galaga coin-op for a Galaga tournament!

** INITIAL POST: 1.28.2000 **
Hey all! I'm here to announce the first annual PhillyClassic East Coast Classic Gamer's Event. We are organizing an event to bring classic gamers together as a group for a weekend of trading, selling, and storytelling!

The weekend of April 14th, 15th, and 16th will be one to remember as classic gamers unite for a weekend of hardcore gaming! Planned events include casual trading/selling, *tournaments*, *auction*, show-and-tell, and a general good time by all!

We have rented a conference facility at the Villanova University Conference Center for the event, which means enough room for a lot of people to come and setup the pride and joy of their collections, and even a little tradebait!

The conference center is COMPLETELY PRIVATE, has security, and plenty of FREE PARKING.

The tentative times are as follows:

Friday: 7pm - whenever -- Setup Night/ meet 'n' greet/ informal gaming/ early bird trading

Saturday: 10am - 7pm (will probably go longer) -- MAIN DAY

Sunday: 9am - noon -- Packup, Final Goodbyes

If you have any questions or would like to help organize a part of the event PLEASE e-mail David Newman (davidnewman@adelphia.net) or Chuck Whitby (intv-sama@worldnet.att.net). If you plan on attending, please purchase your tickets early and make those hotel reservations!

Thank you very much!

1893. Floppy Drive Emulation Project. Require Information Please.....

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-22 00:00:00 UTC
From: Boosta@Boosta.net
Message-ID: <38d8a9f0.633094@news.supernews.com>
Source record: 45904

Hi,

I recently bought an old Atari 65XE computer and I'm interested in writing a program which will fileserve to it from emulator compatible disc image files.

Ideally I would like to connect to the host through the floppy disc port and be able to emulate say a 1050 drive.

Can anyone tell me whether this is fairly starightforward in terms of command passing or whether I would require any cpu emulation on the drive side.

Also, before I go ahead it would be interesting to know whether anyone has already done this.

Many Thanks.

Boosta.

Paul,

I unfort dont have the means of making a dump of Airball. Th eonly cart copy prog I have is a basic util that only works on an Atari800 and 16K carts! I can dump Star Raiders if you want it :)

If someone knows of another way I can do this Im all ears.

I really like Atari800Win, except I can't make it work with OSS supercarts like Atari800 for DOS. The source code seems to show support, but the Atari800Win emulator does its virtual crash when I install an OSS cart rom, even though the same rom file works with Atari800 for DOS. If anyone knows how I can make OSS carts work with the Win version 2.5C, the one at the web site,
http://www.concentric.net/~Twist/atari800win/
it would help me out a lot.
Thanks.

I use ataridsk flawlessly to tranfer atari files and bootable disks over to PC. It's a lot of work to move bootable disks, but it does the job.

Also works in Windows 9x Dos window. But yes, you must use double density disks formatted using ataridsk on the PC drive. My US doubler 1050 drives write to them no problem with MyDOS and SpartaDOS.

I am not aware of the 4k window. As far as I understand, There is a
libary of routines that is in one of the 8K banks. It is switched in
and out as needed.
The hardware in the cart as far as i know cannot do 4K windows.

there are 2 ways, one is to pull the cart apart and read the rom
direct. (long and hard way)
the second is to manually step through each bank in order and copy the
contents to ram/disk file then reassemble it.
The second way requires knowlege of the bank switching.
Have done it once before with deflector.

The obvious has been stated, but there use to be (I don't know if you can still find one) an add-on from ICD called the XF-Enhancer. It allowed you to format FLIPPY (1050) disks w/o cutting the extra timing hole, directly read both sides of FLIPPY disks and more. It was pretty cool. I had one once. Wish I knew what I did with it. I'd love to have another one. It ran about $50 when it was readily available.

1916. Atari chat session, tonight at 8pm CST!

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-23 00:00:00 UTC
From: Greg Goodwin <drclu@swbell.net>
Message-ID: <38D9F93B.19C1@swbell.net>
Source record: 45927

Just wanted to invite everyone here to this week's (and every week's for that matter) installment of the Atari chat session that we have going on. We usually have it every Thursday night at 8pm central standard time, and we talk about a wide assortment of things Atari.

One night we broke open a modified 800xl to see what it had inside, another night we talked about Jaguar developments, never really know.

So stop in, be good to see you there!

http://stargate.cs.swau.edu/atari/

Take care,

Greg Goodwin aka "Doctor Clu"

It really just depends on the cart and what the designer<s> wanted to do. I seem to have lost some of my designs, but on the most basic level you just put a latch in there, OSS super carts used a 74LS74 tied to the data buss, and some glue logic tied to phase 2 clock, cart contol line, and maybe an address line or two if you don't want to hog the whole $D500 page. I imagine banking in even increments like 2k, 4k, 8k, would be the easiest to implement since you are just tying the latches to the EPROM address lines.

There really isn't anything magic about the addressing. I made a couple of through carts that were compatible with SDX and Action! They would have been compatible with an RTime cart too. It only took the addition of a 74LS138 to get the addresses passed through properly and I used both 74LS174 hex and 74LS374 octal latches for my own purposes. Oh, and about 30 FREAKING feet of wire wrap, emphasis on freaking. The damn things looked like a bird had built a nest out of wire wrap, it was a complete mess.

APE and SIO2PC provide this functionality for DOS. I wrote a simple
program to do this on Windows and Linux, but ended up losing the working
versions in a hard drive problem. It wouldn't take much to reapply the
last few changes to get it working, but I haven't gotten around to it.

If you want an original copy of the Pool Disk for $5.00 can produce it.
Costs you $3.00 for s/h
but 5,000. not sure you are getting all of it. I added 3 clubs libraries
to the CD I have updaged and there are over 9,000 files according to the
cd-writer program, all p/d..well if the market is getting that bad..then
I will lower my price to $10.00 per CD-ROM with about 80% of the Pool
disk and 3 USA club libraries, to $10.00 plus $3.00 s/h.

If someone wants a Pool Disk firt edition then they can also have it for
$4.50 plus $3.00 s/h...

Been there done that! Going there again!
bob

Being as old as I am, I was brought up differently than those of today environment.

I was taught to respect the rights of others, earn my way in the world, either I worked for it, bought the rights to it or accepted the rights of others. In my demise I am sorry to say this world has come to a point that I personally do not wish to continue. My or any other persons demise take up to a far better place, where perhaps old values will be acknowledged, I personally hope so, if not then I guarantee you I will be back to haunt anyone that thinks they have the right to anything they have balls enough to desire and reach out and take what is not theirs by origination or purchase.!

It is a sad place we now have to live. I want it, you got it too bad, I am going to get it any way I can. You (not the originator of the message) are too damn cheap to purchase things you wish out right so you infringe upon others rights! I paid my dues to the Atari 8-bit through cash outlay, harassment, and have even extended myself to pick up of Mike Hohmans slack where I could, as I did process his first credit card purchases..Have personally paid some of his debts and as a friend. Not that he Mike owes me a damn thing, he doesn't as far as I am concerned I did what I did for him as I would any friend. You say pirate his stuff, go for ti. I may even file suit et al, in his behalf. Because it does not belong to you! It does not belong to the community we all support, unless you have paid for it or supported it as a group!

We all had our chance to take on Tom Hawker, of ICD, he held out until he found a sucker which was Mike Hohman. I Bid on ICD's Stuff along with several clubs..Tom Took Mike to the cleaners, pisses me off, and should piss you off..

I don't know what supporting the Atari 8-bit community, has cost many diehards, but do know what it has cost myself. Damn near a divorce, and I guarantee you that there is none of you out there with the money I have spent on your efforts is worth a damn dime for the 39 years my wife has put up with your crap, invading my copyrights and the money I/we could have been on one hell of a vacation somewhere in the world without any of this bull crap!

I bought the rights to the Supra Hard Drive Interface early, paid dearly for it, expanded it with the efforts of a couple programers still on this sight. Not one damn dime has come back in on my efforts or theirs. I bought the rights to BBS Express! Professional, never did with the programers break even. Bought out the Rights to Hard Back and Restore, not even 5% on the investment return. Never received orders, as the program was out on several BBS's at the time for free download!

Stupid you got it I was so stupid to think that the Atari 8-bit community would back some of my efforts..

Here is a tear jerker for you!

Mega dissembler was written by Dan Knauf, I own all rights to it never been released, have source ect, has a flaw but could break down any program down into 3 programmable items, Basic, M65, and Action. Dan worked his butt off, had medical problems, last I heard and sent money to him he was living ain a Camper in his brothers drive way. He did DK-Utilities for the Black Box and MIO. I asked several years ago for users of the program to donate to his behalf. Received approximately $100.00 which I put in $50.00 myself. The man spent years of his short life dedicating to the 8-bit world programing for you new comers stating I want it You DON'T have any right to hold it! Get a life, yours is much shorter than you think, mine doesn't matter anymore!

But don't be so damn cheap you can not extend yourself to spend a couple $$ to assist the programers left to support your habit!!!!!!!!!!

Pretty soon you will have no one to bitch at but yourself!!!!!!

Bob Klaas

1924. Atari 800 game "SCRAM" - anybody have on floppy or cartridge ??

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
find it hard to keep up with NewsGroups.

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-
Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at
http://www.atari.benjamin.net And Jump to my FTP site linked to my Web
Site so you can Download Free Catalogs or FTP directly to my site at:
ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way,
Feel free to Request catalogs through E-Mail. Really, it's not an
inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both!
Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail.
Please let me know if I can attach text files to your E-Mail. Catalogs
are just regular ASCII text files so you can download them into your
text editor and view them, edit them or print them out! It would make
things easier for me if you take my Catalogs, load them into your text
editor, delete what you don't want and E-Mail me the rest! To expedite
things, include your complete Mailing address so I can figure your
Shipping/Postage & Handling. I'll be back after the weekend.

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. So checkout what's new on
my WebSite. In Fact, check it regularly as my Catalogs are updated
regularly. Customer's are served, first come, first serve! I have 6
different Catalogs, and my SoftWare Catalogs are my largest. They have
the biggest Byte Count. You should see my inventory! I have TruckLoads
of HardWare, Boxes & Boxes of Software & Libraries of Books & Reference
Material for the Classic Atari 8 Bit & Atari ST! And remember, if you
can't come see me today, come see me tomorrow!

Click for WebSite!

Please Direct all Replies Through E-Mail to: atari@benjamin.net or

Well, if I run out, I can always write a few fresh copies.
I still have a spindle of CDR's I ise for my own backups etcetera.
I can spare a few of those. It is just that I wrote 50 sets up front
and really want to sell these so as to recover the investment.
But I had about ten left, and several folks responded by
sending me E-mail. I think I still have 1 or 2 left when all these
orders really drop in my mailbox. And like I said, if I do run
out, I would be happy to write a couple of additional ones
at the same price.

Keep those XL's/XE's humming.

Hi Bob. If you offer folks copies of the stuff we put on our CD,
there are a few rules that should be considered.
First off, *most* of the stuff on the Pooldisk is public domain,
shareware, freeware etc.etc.
However, there are a few directories that contain stuff that we
were allowed to put on the CD with the restriction that the stuff
would not be copied!! I have not seen the CD's that you sell,
so I do not know what you put on your copies.
But please note that the ANG stuff, the POKEY stuff and the
MEGAZINES should not be copied!
Apart from those, hey, it is supposed to be copied.
The same is true for Pooldisk Too. There is some stuff on it
that we had the right to put it on the CD, if no copies were
made. Like the text of "mapping the Atari". Anyone copying
stuff from our CD's should therefore not copy everything!
A verbatim copy (exact duplicate) is thus an act of piracy.
Like I said, I have not seen your CD's, so I cannot tell whether
you did or did not comply with these rules, as stated on the CD.

One thing though, we absolutely reserve exclusive rights to
the name Pooldisk. So if you copy our stuff, name your CD
something different than Pooldisk. The name Pooldisk should
not appear on your label, inlay, jewelcase or whatever.
Therefore, you cannot sell a Pooldisk first edition. unless
you sell the one you obtained from us.
If you sell copies of *the stuff on the pooldisk* that is
not a problem, as long as you do not name it Pooldisk.

We just want folks to know what they get when they buy a Pooldisk.
There is no big money in this stuff, and thus we cannot pay
$200/hour lawyers to enforce all this, but we assume that
common courtesy is enough to keep everyone happy.

We no longer sell the original Pooldisk since the Pooldisk Too
contains all the stuff of the original Pooldisk and more.
Well, we dropped the XFD files, but apart from that, everything
is on the Pooldisk Too.
Hope this clarifies the rules as stated on the CD's.
Spreading Atari stuff around was our goal, so we do think
that your efforts help the community, but we have to
protect our own trademarks too.
So we are not at all mad at you, just wanted to make
this statement to avoid confusion.

Bob, I have respect for you and the dues you've put in, so don't take what I'm going to say personally, just reflect upon it.

Anybody who thinks they can make a living off of the Atari 8-bit line of computers needs a reality check. Ask anyone, and they will tell you I LOVE my 800XL, but it stopped satisfying my computer needs in '90-'91. The number of people that are still using their 8-bits gets smaller every year, which means that eventually there will be no more 8-bit users (of course, this would have to happen after I die! :-)

BBS's are now a memory, with the web taking over. They have been on the down slide for the past 4-5 years. I've thought about putting an Atari 8-bit BBS up, but decided it wouldn't have 1/10 the features of a BBS I put up using Linux and a $10 486 I bought. Or, you could put up a Web site with files, discussion boards, etc. and multiple people can access it at once, 24/7.

I made the (probably) final purchases for my Atari in the past few years, with APE and Action! There is nothing new on the horizon that I desire or need, but I will still be using my 800XL forever. (Although I still need to find a 65XE to complete my entire line of released 8-bit computers.)

Mike H. did a service to the 8-bit community by purchasing the rights to the ICD products, but he did a dis-service by taking the money and running. I'm sure if he would surface and tell his story, and make some sort of effort to make right with the people he has wronged, we wouldn't be discussing the pirating of SDX.

The 8-bits are now unfortunately a hobby. They will never attain their success they had in the '80s. If you are writing software and creating hardware for them for the money, then you are in the wrong business.

Now to put a positive spin on this, the 8-bits could come back if someone wanted to invest in producing a "GameBoy" like version! Wouldn't that be cool!

Whew! This is probably the longest post I've ever done!

well ryan i have to respond to you.
i make my living selling this stuff,as does best elec.,and b&c comptervisions,all 3 of us have no outside income,that means this is all that we do,and my life is just fine,infact all 3 of us have freedoms that most wage earners can only dream about(and i am not dispariging wage earners) but you are right,its not a get rich quick thing,its just what we do,and enjoy.
also we do put out some new software,mixed in with oldies,and it does ok,i joke that we are the microsoft of the atari world(the word micro is true)and it does provide the actuall user's with pleasure,they say they are very pleased that they are not being overlooked,in fact about 90% of our sales are from actuall users,not from the internet,but mail&phone order's,you would be surprised on how many people/small bussiness still use this stuff,nd they bought it new,and my use it till they hit the grave.
you see the PC world gives them nothing to get excited about.
the st.paul newspaper just did a article about all of the users still using classic computers in the mpls./st.paul area(3 million people)and the fellow that interviewed me was just wowed on all of the people,and small bussiness that he interveiwed for his story,in fact he became almost over facinated on how well this stuff worked compared to his PEE CEE.
i do have programmers who do royalty work for me,and they would not like me to give up the software end of this,they are not getting rich,but some money comes there way,and they know that they are filling a nich,ad making the end user's happy,they tell me that the extra money comes in handy.
and i think that we are sane,and still in the right bussiness,thanks,
lance

<< I am not aware of the 4k window. As far as I understand, There is a libary of routines that is in one of the 8K banks. It is switched in and out as needed. >>

Which is why I'd wished I'd saved many of the old GEnie chat logs. There were some very good discussions about SDX's 4k windows, the held in place library routines, supper maps, the data base program that never made it in to SDX as well as, I'm sure, ton's of things I'm forgetting.

What sticks in my mind though was that there was a 4k window held for common routines, bank switching and DOS management; a held in place window (while the cart was active) of SDX Library routines and an 8K window for the SDX programs to switch into before being relocated to LowMem.

I had to do some digging in the old file cab's but I was able to come up with and old DataQue catalog (Chuck Steinman) and an ad for his supercart.

(Quoting from the ad)
To simplify programming, the TBC-4001 (Supercart) forces the highest available bank into the upper half of the cartridge (4K bytes) at all times. This removes the hassle of recalculating the cartridge checksum on the XL / XE's each time the bank is changed. Also, that bank will always be entered through the OS system reset / init, so you do not have to duplicate that code in each bank Since this bank is always accessible, your bank switching and other often used subroutines can be located here for optimum performance. The lower 4K of the cartridge will power up randomly, so your init code will have to initialize the select register.
(End Quote)

Just for pure S&G I went and looked at a dump of the SDX 4.20 rom and sure enough, there is what looks like a 4k block of code (I didn't count the bytes) at the top of what would be Bank 0, and a block of code and Library routines filling what would be Bank 1.

1934. Atari Chip Numbers?

My experience with the XF551 and also my Astra Big-D (which I sure wish I still had!) was that it was the DOS (my favorite was TopDos) that determined whether or not it would properly sense the density of the disk it was booting or reading. I tried using both SD and DD with the XF551 and ProSys, but the drive would not synchronize no matter what. Since the borrowed 1050 will no longer synchronize either, I seem to be out of business.

If Mike Hohman contacts me I'll make him a one time offer to buy the rights to all the ICD junk he owns. Then I will turn the entire line over to the public domain for all to share. I will need proof of what he invested in the products, not that he will get 100% of his investment back but I'm offering to help him get something back. I have the cash to back my offer, I'm 42 and I just turned in my notice to Time Warner that I am retiring march 31st. Go Qualcom!

Hello all,

I am still looking for Roy Goldman and his Daisy Dot III program.

All I can find is a shareware version of the software out on the web,
including XLSearch.

I am looking for a Registered version of the program. So I can use more than
one font per printout.

Does anyone have any information about Roy? Where he could be? I hear that
he is in California.

Thanks for all your help.

I did take about 1/2 a decade off, but I was supprised at the number of
disks I have that just plain degraded, they were fine for the first 10 years
I had them, but they went under in the last 5. It looks like the polymer
that holds the magnetic oxide together broke down on some, others look like
oxide has pits/blooms. I live in an odd part of California, micro climmit
that gets 100" of rain a year, only 5 miles from Sillycon valley where they
only get 20". I probably have more problems then a person living on a house
boat.

There may also be a slight problem with Prosys software relative to Atari
DOS. I really don't know what the current Prosys does as I only have a beta,
but Atari DOS has built in retries. I think the default is 5 retries if DOS
gets a bad checksum or some other error. It looks like the copy of Prosys I
have just tries once and either gives up or moves on.

Don't know if you caught my other post, but I found the problem with your
cable. One of the lines in the Atari cable was broken, so it would never
have worked. I left the fixed cable on with an 810 for ~72 straight hours
and it was still working fine at the end of the test. I believe the 810 and
1050 both use the 3086 transistor array as an input stage so if there were
problems with a 1050 I would have seen them with an 810.

I would suggest examining the disks in question and looking for any tracks/scratches or uneven surface. If you find one that looks like it has a problem, I would bet it left the 1050 read head dirty.

Bob's a nice guy, honest and generous with his time. Not sure about you however.

I consider it kind of normal to rant a bit when you get boned up the ass. I mean you can argue that people should know that most Atarians are all pirates and thieves, BTW he does, but you can't argue that someone should take it up the ass and like it. Just how life works.

no he is not,he's just someone who has done alot for this community,and he got stomped on not only by atari,but on just about every atari device/software he ever invested in.
he has taken more abuse then i ever would have,and keeps making products availible out of his own pockets for this community.
he knows that this machine has a kinda aurora around it then the PEE CEE can ever have,its almost mystical,he does it for the machine,and the dedicated people who still reley on it as there most used,or only used computer.
if microsoft,and all of the other half baked so called modern technology companies were half has dedicated as bob klass is,you would now be using a real computer that does not have to be reset every time it sneezes,thanks,

Gozar,
Well spoken. True, the Atari 8-bit line is getting smaller every day, but the rate at which it is decreasing is not a steady progression. Keep in mind that while there are some who may have all they need, there are always those who step out for a while, and then step back in. I'm one of those.
Then there are those who plan to stick it from 1979 till .. whenever.
The 8-bit is a fine machine. As I've learned, all computers fill a need, and it just depends on the user. Some like to be on the leading edge of technology. I have resolved to let me work foot the bill for the up to date computers. :)
Meanwhile, I continue with a computer that will do what I need it to do... logging on to the local BBS where I check my E-mail, newsgroups, and so forth (Thank you Bob Hoffman of the Family Net BBS!) I also have all the other various useful programs I need on the 8-bit. The fact that I can do all this today on the ole faithful Atari8 is fun. I also realized that the games I enjoy were eventually being emulated or remade on other platforms, but I realized... if you want the best speed and the best selection of games for the Atari8, why not just run an Atari8?
Praise the internet for the large library of software for the Atari8 that I can gleem off of, and for those that keep them available. Making money with Atari8? Well, you will have those that need parts, those who like to try new software, and new gadgets on their machines. This hobby is open to the poor person needing a word processor, to the rich person wanting to buy the rare Atari prototypes. Can you make money off this hobby? Not a flowing river, but a slight trickle at least.
Will Atari8 machines and BBS's ever did off? I don't know? Do you want them to die?
Take heart, I think the newsgroups is a great Atari community, and the fact that you can log on to the newsgroups with our various means is a BBS in it's own right. The internet is our filebase, and all the computers on the internet our resource for further ways of bettering and improving our setup.
For some the Atari8 continues through well maintained machines that are sometimes over 20 years old, and in others they have continued the brain of that Atari8 in the new body of a Pentium III with tons of power.
In truth, I think there is no better time to be an Atari8 user considering all the above. :)

Video61,
It amazes me also that older technology, like the 130XE is worth more than a 486, which came out considerably after the Atari8 had vanished in the production line.
Guess the price is more for nostalgia, rarity... and I think that about sums it up.
Speaking of which, I never cared much for the 130XE, but you know, the XEGS isn't half bad... :)

I guess, Jemma, you have the word by now. As a guy who still follows the community somewhat through this ng and emulation, I have to say that I agree with all the comments.

Most of the people I know who have been in contact with Bob have done so because of his role in providing BBS Express Pro to the masses. I have a very warm spot in my heart for Atari BBSing, particularly where it involved netted BBSs. The Internet and PCs come close to that experience only where this ng, and perhaps chat sessions are concerned. That Bob's was a crucial role in creating that feeling cannot be denied.

Yes, Bob's style of writing and choice of words are sometimes extreme. So what? When you care about maintaining this community as much as he does and constantly get smacked down, you, too, will lash out (Richard Cortese and the others said it better!)

oss carts do have a 4K window. Early oss carts have a 74ls175 latch.
My basic XL yellow label cart has that along with 2 8K eproms. from
memory, only address lines are used for the bank switching.

dear greg,
no its really not for nostalgia,its because so many small companes still use them,we sell mainly to users of charactor generators(hospitals,airports,parks,etc.)
they find that they can run one of these units to death(that means many years,24 hours a day,with no problems, not like what you get with a PEE CEE)it is rock solid,the only time they go down is from being on for many years(decades)or power failure,try that with a PEE CEE,you never know whats going to happen from minute to minute on that thing.
but we also sell to small bussiness,many just use it out of there own houses,but its what works for them.
i agree with you,i like the XEGM,only i wish it had a parallel port.
i have a 10 foot long cable hooked to my keyboard,and i can bring the keyboard across my office,its cool,type it across my office,dump it to a printer,then i only need one computer in my office,thanks,
lance

I had the same problem with my Astra Big-D. You can't do it unless you punch another set of timing holes in the disks. Believe it or not, it can be done! First make a cardboard template of a disk with the timing hole punched out. Then you can flip it over and place it on the disk you want to read and mark the hole with a soft pencil. Make another strip of cardboard about 3" x 1". Taper it at one end. Insert this strip through the large center hole so that it is between the media and the top of jacket. Then you can punch the hole without damaging the disk. (Hold the paper punch so that you can see your penciled circle through what might be considered the bottom side of the punch.) You have to do this to the other side of the disk also.

Try this procedure with a disk you don't care about the first time. After a while, you'll find it easy to do. I never damaged a disk doing this.

Carolyn

Just to let everyone know. I've got a brand new Atari 1010 up for bid on
E-Bay under:

New Still in Plastic Atari 1010 w/ all cables
Item #293043515

It is on sale for the next 5 days. The item is brand new and still in the
original plastic, the box is still in great shape and all the cables are
with the auction. Read the description for more info.

I have sold all my other items and I thought I should let the Atari group
know about the 1010 first.

Thanks for your Time,
Arron

From: themrfreeze@my-deja.com
Message-ID: <8bk2ri$41h$1@nnrp1.deja.com>
Source record: 45770

Hey all.

I was cleaning out one of my closets today in preparation for moving, and
I found some miscellaneous Atari stuff that I no longer need:

*Two SIO cables, plus a third that was cut in half (the other half was
used to make an SIO2PC interface)
*One Atari 9VAC@31VA power supply (for Atari 400/800, 1050 drive, etc.).
I'm pretty sure this works
*Four silver Atari Service 3-ring binders, all in mint condition

I'd hate to throw this stuff out if somebody can put it to use, so if
anybody wants it for the cost of shipping, it's yours. The first E-mail
to arrive at the address below gets it.

Thanks,

Chris

You may be right about my old disks being deteriorated. The current ProSys only tries once, then gives up. Since the 1050 quit working with ProSys, I have tried reading, writing, and formatting with the program, but the drive won't even come on. The 1050 is now acting like the XF551 has been all along. I can't even use the usual cleaning disks because I can't get the drive to run. Remember that I no longer have my Atari computer, so I can't be sure whether either drive would work in that situation.

BTW, I've been trying to send you e-mail for days, but it won't go. (No problem with sending to other folks.) Here's the error I keep getting:

An error occurred while sending mail.
The mail server responded:
netmagic.net does not match anything.
Please check the message recipient and try again.

Carolyn

P.S. - I'm happy that you are able to use the cable I sent to you.

: Well, he's too kind, if that's the kind of insane your talking about.

Well, threatening to take out a lawsuit against people who would Dare to PIRATE Sparta X Roms on Mike Hohman's behalf is pretty extreme.

If he does that, I can be sure that there would be a bunch of people who would be willing to class action sue Mike Hohman. If such a lawsuit is filed (which I think is hot air) I would surely encourage a class action countersuit. This is simply NOT a matter of respecting copyright....

Is Bob Klaas a nice person who has done a lot for the Atari Community?

Of course. However, it isn't our fault that he lost money on purchasing rights to Atari products. I know _I_ supported him by buying his BBS upgrades. It is unfortunate that Bob lost money and had marital problems over his Atari business......but come on.....let's be reasonable.

Bob mentioned that Mike Hohman got suckered by Tom Harker for the ICD products......I agree with this. If there ever was a shady person in the Atari community, Tom Harker is one.....do some research on the web and you will find there are a bunch of people who allege to have sent him all kinds of money for Catboxes for the Jaguar, but never got anything in return.........if Bob wants to be outraged, why not direct it to Harker?

Again, I feel bad that Mike got ripped off by Harker and lost lots of money......however, that did not give him a green light to take money from people for products which he never delivered. Bob may have truly been motivated by friendship by trying to "clean up" some of Hohman's mess, but he was also an instrument of the fraud, by Hohman using Bob/K Products to charge credit cards for products which were NEVER delivered.

Hohman disappears, with all the rights to many products, AND lots of the Atari community's money for stuff he never delivered......and we are supposed to feel remorse for distributing FTe software......don't make me laugh!

Well, if that is the case, I would be happy to supply you with a number of Atari 130XE's at 50 dollars US a pop.....that would be a tidy profit for me.....and if you have trouble keeping them in stock at that price profit for you.....

Seriously.....if someone wants a 130XE, I'd be HAPPY to sell one for half what you offer them for. I can't believe someone would shell out $100 US for one....really.

1965. MAX 233 data

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-26 00:00:00 UTC
From: llpwhite@cs.com
Message-ID: <20000326064118.04363.00001531@ng-fk1.news.cs.com>
Source record: 45776

I want to build a couple more varieties of SIO2PC/APE cables, including the "ProSys" version. I do want to try the MAX233, but I am having trouble finding detailed information about it (this is not the more-common 232). With the few IC's that I have bought from Radio Shack, they generally provide a spec sheet with pin-outs and some basic data. Anyone have some suggestions as to where I might find similar data -- either books or on the web?
Thanks,
Larry

Funny,

I guess I was the only one here who used to own 1050s along with my XF551 :)
I'd format the disks, front and back, in a 1050 and then make all the
flippies I wanted to in the XF551.

Sounds a lot simpler than punching holes!

That sounds ugly! I mean you should just be able to insert a cleaning disk
and close the door, then the 1050 should spin up trying to determine
density. If it isn't spinning, then its on board 12V power supply is munged
or one of several other problems.

OK, good newsg/bad news thing about going with a small ISP with only 2-3
people running it<netmagic>. The people that run it are gamers, so they have
a pristine connection and plenty of bandwidth. Bad news is they started off
with a linix guru who they bought out. I think I went almost two years w/o
having access to the newsgroups and everytime they lose power when the
squirrel dies I can't connect or be connected to anything other then maybe a
game of Quake or Descent, neither of which I play.<grin>

>
> P.S. - I'm happy that you are able to use the cable I sent to you.
I'm kind of obsessive, not complaining about it because I like it that way.
I wouldn't have been able to sleep nights if I didn't find out what was
wrong with the cable. Thanks for sending it to me.

I should try to get back into Atari a bit, figured out a way to add hardware
8 bit multiply with a couple of PIAs and EPROMs.

I'm sure that business that use them as character generators require
purchases from a business, not an individual (and I'm sure Ebay would be
frowned upon).

1973. Newbie - how to test ATARI 1050 drive?

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-26 00:00:00 UTC
From: "E.Hillebrand" <edo@edohill.demon.nl>
Message-ID: <954100951.12176.0.pluto.c3ade537@news.demon.nl>
Source record: 45784

Recently I finally found an atari 1050 disk drive.
Today I hooked it up to the 800 XL and the computer
returns BOOT ERROR when I power it up.
I don't have any ATARI disks so I tried to access the drive
from basic. eg. LOAD "D1:TEST.TXT"
the atari returns ERROR 130 (No device available)
Is this the correct way to do this/or is there a way to format a disk
from basic?
I tried D1 trough D4 but all the same results.
How can I test the drive...
Also I'm interested in connecting the drive to the PC to copy files etc to
it.
I saw that there is a parallel version and a serial version..which one will
work properly?

Thanks,

Edo

I am not arguing here. However, the point is, that Hohman is hiding from people he owes money/products to.

The point is, that people would welcome him to defend his rights. They would then be able to nail him to the wall for fraud.

I guess it depends on what you think is worse.....copying 8 bit Atari software or defrauding people?

It is obvious that Hohman forfeited his rights to the people he ripped off.....they are in reality (myself included as I never received all the products I paid for despite Mr Klaass sending me some of the order on Hohman's behalf) CREDITORS.....who could claim FTe's assets due to FTe taking money for which they never shipped product.

My personal view is that fraud is much worse than copying software. It is just people with a stake in the piracy issue (people who have convinced themselves there is still an 8 bit market) who take it personal and ignore the fact that Hohman intentionally or not, ripped a bunch of people off!!!!

This is so clear, I can't understand why people are harping on requests for Sparta X roms......piss on it I say.....copy away! It isn't as if FTe would actually DELIVER the product if you sent them the money......duh!

Hi Richard-
Sounds neat. Did you ever see a game that was quite like "BattleZone" that came on disk,
but had an integer math cartridge that did all of the crunching for positions? It was fairly limited, but certainly made me think that adding a 8087 or something similar in a cart would be a plausible proposition for floating point. I'm reasonably sure that I still have some doc's about the cart.
Regards,
Larry

Here's my plan. Add two PIA chips, The first PIAs output lines are tied to
the address lines of 2 EPROMs, the 2nd PIA has PORTA tied to one EPROMs data
out and PORTB tied to the other. In use, you would just store two 8 bit
numbers in PORTA and PORTB of the first EPROM, and read the 16 bit result
from the 2nd. Not very versitle, but should be as fast as a real math chip.
I should only need a total of 64k of EPROM.

That may just mean it is not a DOS or boot disk. Atari DOS is loaded on boot up, so you may have a chicken and egg type problem.
> Is this the correct way to do this/or is there a way to format a disk
> from basic?
<snip>

Just a suggestion, build an SIO2PC type cable. Switch your real 1050 to drive 2 using the switches on the back. Boot your Atari using the SIO2PC cable and virtual drive as drive 1, then format and write DOS files to your real 1050. You can then swap things around as you want, i.e. use the 1050 to boot the computer vs start up your clone everytime you want to use your Atari.

Source record: 45794

SInce you didn't mention anything about DOS I am assuming you tried to boot without any DOS. That's why your getting Boot Error. If you send me a blank disk with a self addressed bubble mailer with postage on it, I will make a copy of Dos 2.5 and MYDOS., two of the most popular DOS's for the Atari.

Allan

>correct way to do this/or is there a way to format a disk from basic?

You CAN format a diskette from BASIC with a USR call to the resident disk handler. Problem is that creating the File Management System normally contained in DOS would be MUCH more trouble than you want. Most of us will send you a disk for the postage.

-Ron

I don't have a solution but I admire the problem.

>troubleshooting and repairing atari's. I've got an 800xl with a dead
>power supply

You could check for +5v; pinouts are here:
http://www.atari8bit.tmfweb.nl/pinouts.htm#monitor

They are repairable; requires LOTS of patience to chisel the components out of that pretty solid brick of epoxy fill. Don't think the XL/XE contains a fuse like the 800/1050; probably a bridge diode.

-Ron

I don't have a solution but I admire the problem.

>
>Sounds a lot simpler than punching holes!
>
>
Not the only one, Alan. I used to do the same thing. The XF551 could read
and write to a flippy, but not format it. The only disk I ever had that
had been created with a 1050 that I couldn't use with the XF551 was a
"hard-sectored" disk, one with several timing holes punched in the disk.
That type never bothered the 1050, but would drive the XF551 nuts.

The same thing was true of disks created in double density with MyDOS and
a US Doublered 1050, and with an Indus GT. The only problem I had with
that was with switching densities. The XF551 wouldn't automatically switch
from single or enhanced to double, but it would go the other way.

Maxim has a web-site with these data sheets:
http://www.maxim-ic.com
It's in there somewhere. There may not be a dedicated sheet for the '233;
it will likely be included as part of a "family" data-sheet which includes
pin-outs and specs of chips with very similar functionality.
Good luck-

Well yeah.. that looked as something that went completely wrong.

I am in search of a power adapter for my 1050 diskdrive. If i am correct it needs 9volts and
3 ampere [if i am *not* right about this please say so :)]. But an adapter following these descriptions is very hard to get..

any tips?

Tnx!
Maurice

william,
you must have gotten out on the wrong side of the bed in the last couple of days.
do you realize how big a company atari really was in its hay day?
if you knew bussiness you would realize that a really big company would develope lots of bussines relationships over the years involving hundreds,perhaps thousands of products.
these products that they sold will not totally go away,HERE IS THE CODE WORD"NOT ALL WILL GO AWAY"
they will continue to use these products till it is not feasible anymore,its the cheapest possible,most effeciant way!
why buy a new PEE CEE charactor generator for thousands,when they can call me and get a replacement one for $99.95 shipped any where in the u.s.a.
there tech people know me,there tech. people know the atari.
we get orders because we have been here for 17 years,how do you think actuall atari dealers still survive?
if you do not get orders,maybe you should look at yourself for how you look at bussiness,and how you represent your product.
if you give people the idea that this is just old junk,then that is what they will think it is. really

With the XF551, you can read both sides of a flippy disk simply by flipping
it. You only need to punch a hole to format the flip side. I don't know
if that applies to the floppy board.

: I wasn't talking about Mr. Hohman.

He is not getting blamed. However, he did process credit card orders for FTe.....they, FTe, did not deliver product. If I sent you money for a product that a friend of yours sells, and that person took off without sending the product, you would be an unwitting part of fraud.

My point was that although I am sure that Bob is a stand up guy, that this part in Mike Hohman's intentional or unintentional fraud would motivate him, in part, to attempt to clean up Hohman's mess.

Anyhow, this is not contructive, so I dont want to continue it. I just get annoyed when people who have vested interests in the Atari "market" are willing to overlook fraud, but hold up Atari 8 bit piracy as the most significant "evil" in the Atari world.

I like the Atari computers, and I have fun with them. However, I am finding more and more that the people who are still using the Atari machines are a bit eccentric if not fanatical. It is just a little too weird for me.

Source record: 45811

E.Hillebrand" edo@edohill.demon.nl opined
>Is this the correct way to do this/or is there a way to format a disk
>from basic?

Here is the code to format a disk from BASIC:

```
10 DIM RDH$(4):DATA 104, 76, 83, 228
20 REM PLA JMP $E453 = Disk Vector
30 FOR L = 1 TO 4: READ B: RDH$(L)=CHR$(B): NEXT L
40 REM put ML code into string variable
50 POKE 768, 49: REM D1; D2 = 50
60 POKE 769, 1: REM Drive # 1
70 POKE 770, 33: REM Command = Format
80 POKE 774, 10: REM Time out value 10 seconds
90 L = USR(ADR(RDH$)): REM execute ML disk routine in string
100 END
```

You may omit the REMarks. When RUN, this creates 720 zeroed sectors on the diskette but you still need DOS to make and manage a directory and a file structure.

You could also read from or write to any sector on the disk by POKEing the transfer buffer address low/high into 772, 773 and the sector number low/high into 778, 779 before the USR instruction. Read sector command is 82; write is 87.

We could e-mail the info to make a bootable DOS disk, but it is about 80 sectors of 128 bytes each. That is a LOT of DATA statements for typing and error checking logic would increase its size.

-Ron

I don't have a solution but I admire the problem.

I have a 400, 800 and a 1200 XL all need a little work. Have 500 disks most with approximately 5 games per side, have accounting programs and many others along with scads of documentation. Was ready to trash the whole heap until I found this ng. All I use my Atari for these days is for a cryptogram solving program. If I could use my crypto program on my MSDOS I wouldn't need the Atari.

Does the emulators you talk about allow me to use the crypto program on a disk on my MSDOS? If so, how do I get an emulator program?

Is there any use for the old stuff I have? What should I do with it? Be happy to donate it cost free.

Pardon me if I'm mis-answering, but

XIO 254,#1,0,0,"D1:" (or d2, etc)

should also format the disk, though it won't write the system files & make
it bootable. Also, isn't the fill value non-zero (0xf3 maybe?) (Hopefully
I'm remembering right...)

The XIO command will only work if the system booted a DOS. The ML routine
below will do the physical formatting of a disk but not put any of the DOS
info onto the disk (things like the directory structure, free space map (for
DOS 2.0S)

Angela,

The Portfolio was a fantastic system; one of the first palmtop computers. I sold a boo-koodle of them when they first came out years ago, and used mine extensively for record-keeping and as a travel assistant. I had one customer that programmed his to drive a laser cutter at a local machine shop.

Anyway, the only things I have left that may be of value to you are:

- Portfolio Owner's Manual
- Atari Portfolio Quick Reference Card
- Atari Portfolio File Manager/Tutorial ROM card

If you want them, you can have all three items for $10 to cover the cost of packaging and Priority Mail shipping within the continental United States. Drop me an Email if interested (s.winick@worldnet.att.net)

I'm out of RAM cards and peripherals, so can't help your there. But the Portfolio has a full series of 5 built-in applications, including:

- Address Book
- Calculator
- Diary/Calendar
- Text Editor
- Worksheet

All the above applications are accessible without any additional peripherals, so the Portfolio is still useful. I would recommend using the File Manager software for easier access to the applications (essentially a menu-driven interface instead of having to struggle with the DOS commands). The Tutorial ROM card is also useful to help you understand how the built-in applications work. And the Owner's Manual, of course, is always helpful. I also have a ton of Portfolio P/D software which I can send you on floppy disk, but without an external interface and/or RAM cards, there's really no way to get it into the Portfolio. I have some neat graphic and sound programs and applications (yes, the Portfolio can display graphics and has a built-in speaker for sound). It was a fantastic machine when it made its debut back in the late 80's.

I never said they had a different matrix or pin out, What I ment was a
different construction like your list. I have only seen (in this
country) 800xl with mylar and 600xl with switches. Looking at your
list, crappy switches. still like my 800 keyboard the best.

2010. Atari800 - bad TV image

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-28 00:00:00 UTC
From: Jindrich Kubec <kubecj@asw.cz>
Message-ID: <38E078A5.B73F1EB0@asw.cz>
Source record: 45821

Hello!

I've recently bought Atari800 (NTSC). I've got few questions:

The picture is really bad. I can tune it only on channel 2. There is
some interfering signal seen over the picture. I've got pretty good TV
set, but I'm from Europe, maybe that could cause problem.

Using european XF551 power supply - 220V 50Hz to 9V AC.
TV is set to America, NTSC3.58, sound B/G.

Is it possible to make monitor<->SCART cable? Will it make image better?

Sorry about the spelling, I've been calling them Geeta and Ceeta for so long I forgot how they were actually spelled. Your XEGS most likey has the GTIA. I would think the best documentation on what numbers go where would be the best electronics catalog. Look for the 'Welcome to comp.sys.atari.8bit' message for a link to the vendors FAQS and check them out.

Yes, a composite cable works fine with the 800. Decent picture and sound.

>If I could use my crypto program on my MSDOS I wouldn't need the Atari.
>Does the emulators you talk about allow me to use the crypto program on

Depends on the quote program, but they probably will unless there is some
really exotic code used.

I like XL-it and XFormer in their DOS versions; start them with a batch file
which loads an XFD image with an AUTORUN.SYS to run the QUOTE4.BAS file.

-Ron

I don't have a solution but I admire the problem.

Recently I bought this ATARI XE game console
The one with the detachable keyboard.
When I power it up the green light illuminates but the screen
remains black with white bars scrolling over it...A little
hard to explain. It doesn't matter weather I use the video out or
the rf.
What could be dead? The machine doesn't seem to respond to anything.

2019. PBI Specification

Newsgroup: comp.sys.atari.8bit

While we're on the subject, could somebody with experience building SIO2PC cables comment on the advantages/disadvantages of the various chips available. I am about to build one and would like to know which is best to use, the MAX233 or 232 or the 1489 like Steve Tucker has on his APE pages, or something else?

Thanks

2028. 3.5 Drives and Disks

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-29 00:00:00 UTC
From: Atari Bob <rwoolley@pacbell.net>
Message-ID: <kjBE4.5$Wa7.4830@news.pacbell.net>
Source record: 45698

I had noticed some traffic about 3.5" drives and disks a while back - what works with what and how to use this and that. So, I did some tinkering which I will share with the group.

This was done on an XF551 with suitable code changes to accomodate the 3.5" format (80 tracks, spin up, seek timing....). These changes are available all over the place, I think. If not, I have them as a text file.

The basic question was: Can you use a modern 1.44MB drive and diskette on the XF551?

Yes, you can - at 720K only. The drive will sense the 1.44 diskette and alter the frequency response of the electronics for 1.44 operation if you use a 1.44 disk in a 1.44 drive. In a 720K drive OR using a 720K disk (no hole in the upper left corner), you are OK. It is getting really hard to find 720K disks and drives, though, so what to do?

What I did was to kill the density sensor in my drives. Now, ANY disk I put in there is going to run at 720K, regardless of a hole or not. To do this you need to carefully inspect the drive. I used TEAC FD-235HF drives. There are many, many variations of these drives, but the new ones all seem to be similar. Looking at the bottom of the drive (where all the wiring is), with the front of the drive pointing UP, there is a small switch in the upper right hand corner. All of the TEAC drives seem to use a mechanical switch that is normally open to sense the density. Just by shorting out the contacts on this switch, you set the drive into permanent 720K mode. Mine worked just fine - I just solder-bridged the contacts and plugged it in. These drives sell new for less than $20, but be careful - some of the models do not have any way to change the address to D0 for use on a stock XF551. You can just re-wire the flat cable like they do in the PC if this is a problem.

As for the diskettes... I used both 720K and 1.44 diskettes in all densities with NO problems at all. DD, ED and SD all work fine. I do believe that the recording medium on the 720K and 1.44M disks is the same, unlike a 720K and 1.2M 5 1/4 disks. The 5 1/4 started life as SD and evolved into a 1.2M at four times the bit packing. The 3.5 has really only been doubled from 720K....

No more haunting the bone yards for 720K stuff!!

Bob

2039. Re: MAX 233 data

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-30 00:00:00 UTC
From: Richard Cortese <ricortes@netmagic.net>
Message-ID: <se6btm52ni7175@corp.supernews.com>
Source record: 45700

It is 99% based on your ability to build kits.

You can't be sure because people don't complain unless they have a problem, but back ~1990 I would guess 70% of the people building MAX232 version were having problems assembling it. The MAX232 is a solid design, just beyond a lot of people for a first electronic project.

The 1489 is a simple design and pretty solid. It seems like only ~5% of the people trying to make them have a problem and over the last 10 years most of the problems can be traced to assembly problems with only 2-3 reports of erratic performance. One of the newsgroup participants here sells cables on eBay and last time I looked he had something like 21 positive feedbacks, no negative. I am assuming that means he has made at least 21 cables and they all worked with whatever hardware, be it Atari 400s to XEs plugged into IBM clones to STs.

Hello Alan,
thats right if you refer to the Mitsumi and other XF drives, which only need a timing hole, when formatting disks. Just format the Disk on another drive and the Mitsumi will be able to read and write to it...

But, its wrong if you refer to the Chinon and other XF drives (Atari used many different mechanics for the XF551) which always(!) need a timing hole, may it be to format, read or write to the disk. In other words: these drives need that damn timing hole, even when reading or writing to a disk. So your trick will not work with these drives. You can format side B on another drive, but when you put this disk in such an XF drive, it does not/never stop spinning, because it cannot detect any timing hole. Thus, you have to punch a hole into the disk or buy disks with 2 timing holes or just leave side B empty... (Pretty shitty work, Atari !!) -Greetings,
Andreas Magenheimer

P.S.: I own both the Mitsumi and Chinon XF551 from Atari...
The Chinon has the big timing hole disadvantage (it always needs it, also for reading or writing) therefore it has some advantages, the Mitsumi does not have: Its a real floppy (i.e. disks flop out of the drive, when opening it), it also has a sort of automatic disk change detection, you can only close the drive, when you inserted a disk, as soon as you close it, the drive motor starts and makes one or two rounds (useful for automatic density detection, like in the 1050 drives, unfortunately the XF-OS does not support that)...

Yo! Paul hows the atari thang going

Anyway, re- thunderfox, the cartridge version was I believe only sold
in the USA, even though silica shop listed it on their 8bit catalog
the UK version was cassette only, although I heard rumours that they
were working on a disk version, pointless because it is very easy to
convert thunderfox to disk with howfendos or td1v (transdisk 4)
I'd be interested to know how you knew of noel daniels, as he used to
live down the road from me in gray's inn road (by what is now the ITN
building) which also was the h/q of the Atari s/w co. futureware (who
also wrote orb of zaramir, and apparently before he left sillica shop,
noel also had a hand in an ST game/programme, which I saw a demo of),
I've known noel since 1986 whenI got my first atari, are you still into
the A8 scene, if so give me an email

Just out of interest I understand that oneof futureware's programmers
also had a hand in developing the ULtimon, the UK version of Omnimon
c/o david young and cdy, apparently ultimon was distributed by
the 'infamous' john lawson, who as we all know, did a runner

Also, perhaps you can help me, I am trying to track down the first commercially available floppy board available in the UK, I believe computerhouse of fulham sld the devices, as they advertised it on the o/s controller card instructions, amongst the features was the ability to attachst/amiga d/d's to thedevice... any help would be gratefull apprec. as I did visit computerhouse a couple of times and also knew own of their employees who untill recently was one of thefounders of London Atari computer enthusiasts (LACE)- Peter Mattock, although according to peter they didn't get arroundto selling them... who knows

keep the Atari faith

Hello Bob,
why should I kill the HD sensor on HD drives ?? Just use a write protection tab (or something similar) from the old 5,25" disks and put it over the HD hole: Now the HD drive detects it as a DD disk and formats it with 720k. I know, these tabs are not so fine, they get loose after some time, but they are easier and cheaper to handle than killing the HD sensor in a 3,5" drive. Besides, there is a way to upgrade the XF drives to full HD (1,44MB/16Mhz) capacity and even to ED (2,88MB/32Mhz) capacity if you like. So, better don`t kill the HD sensor yet, you may need it in the future... Andreas Magenheimer

Hello,
I was told this game was written by Jerry White for First Star Software,
its very rare, but avaiable for the Atari. Kind of educational game,
with Mount Rushmore as title picture...

Hello,
thats not true - it depends on your XF551 mechanic... Mitsumi will do,
Chinon will not/never (because it also needs a timing hole for
reading/writing disks !!) greets- Andreas magenheimer

Hello Mark,
actually Canada is "so far away" from me (Dire Straits), but I do have the original Diamond GOS Version 2.0 on cart plus Diamond tools (setup disk, GOS painter, GOS writer) on diskettes. Price would be 30 US-Dollars plus shipping, if you are interested...

ABBUC (also Germany) has most other Atari carts avaiable for about $1.50 (one-dollar-fifty-cents). Call them via
http://www.atari-computer.de/abbuc
Once there write an EMail to Wolfgang Burger and ask them for the current price including porto & shipping, etc. On the other hand, you can also look for B&C Computervisions, Video 61 and Best. I am absolutely sure, they have these carts in their inventory...
greetings - Andreas Magenheimer (Germany)

Hello Robert,
50 US dollars for that is a little to pricey. Here in Germany certain
vendors made such a "timing hole redirection" for about 10 german Marks
(5 US dollars). Nowadays you can merely get some schematics which will
help you to make them yourselves. Ask ABBUC for such a schematic (german
word: "Bauplan" - since you will find a "Bauplanliste" at the ABBUC
homepage). Here is the URL:
http://www.atari-computer.de/abbuc (Andreas Magenheimer)

Thats wrong !! It all depends on the drive mech, since the XF had many
different mechs, there were/are some drives which will also not read nor
write, if you put in side B without a timing hole !! These drives never
stop spinning, so you just can a) use only side A, b) use disks with 2
timing holes or c) use DS/DD (360k). Alright ?!?

Has anyone other than me noticed certain "threads" being deleted out of this newsgroup? What ever happened to freedom of information and personal opinion? I'm referring to the "KLASS BASHING" threads over preserving SDX ROM images.

As far as a legal action over SDX ROM's as threatened by Mr. KLASS on behalf of Mr. HO-MAN, bring it on. I'm sure they could get a Lawyer used in the past to send a cease & desist letter gratis but the real question is how much will anyone *really* spend to recover not one dime of the legal expenses? And any judgement will just be a worthless paper as far as I'm concerned because the courts do not collect judgements, they just issue them. In my case the judgement would be against a Corporation, which personally hides me behind the "Corporate vial" protecting my personal wealth from seizure.

With my Corporation being $200,000 in debt what's a $50k or more judgement going to do?, absolutely nothing except drain the pockets of the plaintiffs.

I just can't see anyone plopping $10K retainer down to an attorney proficient in corporate law to collect nothing. Atari software is dead even if the copywrites live on, the least these authors could do is release what's left into the public domain for legacy preservation of a time past.

Hi Everyone,

I've posted the first public release of Ape'98/ProSystem'98 at:

http://www.nacs.net/~classics/ape/download/ape98trial.exe

There are no links to it on the web site yet, so this is the only
way to download it. The download is approx 2mb, and requires you have
Windows 95 or 98 installed.

Ape'98 has been under construction seemingly forever :) I hope you
find it useful.

Steve

I think it is alot of hot air. This guys days of hiding would be
over if some lawsuit came up. I'm guessing that hiding is more
important than defending copyrights, otherwise he'd be facing some
real lawsuits from many people...

The Mitsumi is a low power drive relative to other 5.25" PC type drives.
IIRC, the power supply uses something like a 7812T which is really only 12V
@ 1.5 amps max.

I tried swapping several other drives into a 551 and always had trouble
getting it to work for extended periods of time. It would spin up a few
times, overheat and flake out.

Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want and E-Mail me the rest! To expedite things, include your complete
Mailing address so I can figure your Shipping/Postage & Handling. I'll
be back after the weekend.

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out
into Atari Jaguar Hardware & Games. So checkout what's new on my Web
Site. In Fact, check it regularly as my Catalogs are updated regularly.
Customer's are served, first come, first serve! No competing in
auctions. Just Sales, Support & Service! I have 8 different Catalogs, &
my SoftWare Catalogs are my largest. They have the biggest Byte Count.
You should see my inventory! I have TruckLoads of HardWare, Boxes and
Boxes of Software & Libraries of Books & Reference Material for the
Classic Atari 8 Bit, Atari ST & Atari Jaguar Game Machine! And
remember, if you can't come see me today, come see me tomorrow!

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

Atari 8-Bit Computers: Frequently Asked Questions / Michael Current

2068. Atari 800 Webserver

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-31 00:00:00 UTC
From: Atari History Webmaster <webmaster@atari-history.com>
Message-ID: <38E4D18C.4A32D78@atari-history.com>
Source record: 45729

Hi everyone,

Yup you read the subject line correctly, an Atari 800 being used as a webserver. With a little bit of help from a terminal server to be the go between and handle the TCP/IP stack and to listen to Port 80 (http) there is now an actual Atari 800 connected to the internet and servering webpages. I received an email from Scott Ward pointing this out to me and I had a look as the website and its an impressive and cleaverly designed hardware hack. Have a look:

http://kl.net/atari/

2069. Name This Game. TIA

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-31 00:00:00 UTC
From: Boosta@Boosta.net
Message-ID: <38e4f1ed.86342847@news.supernews.com>
Source record: 45730

Hi,

I remember playing this game on a friend's atari 800 about 15 years ago and I'd like to be able to track it down.

It's a plan view strategy game where you control troops and a helicopter.

I think it was vertical scroll only so it's definately NOT choplifter.

Any suggestions would be very welcome.

Many thanks.

Boosta.

2070. Abuse - Anybody know where to get the ATR ?

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-31 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <ME7F4.19235$Xk2.77674@tor-nn1.netcom.ca>
Source record: 45731

Does anybody remember a program called "abuse" ? It would generate random putdowns etc. some of which were quite funny. If anybody knows where I could get an ATR please let me know.

I also remember that there was an X-Rated version with stronger language.

Thanks,

Richard.

2071. Dont Want To Miss This!

2072. SIO2PC ATR file problems.

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-01 00:00:00 UTC
From: "E.Hillebrand" <edo@edohill.demon.nl>
Message-ID: <954616492.410.0.pluto.c3ade537@news.demon.nl>
Source record: 45643

Yesterday I put together the SIO2PC interface with the MAX 232
I can load some ATR files to my atari like frogger2,pacman but
almost 90% of the ATR files crash the ATARI during loading.
Screen goes black or other strange things.
Are the ATR files bad? Or is there a setting I don't know about in the
SIO2PC program? Are ATR files meant to be loaded back to the 800XL/XE

Any help appreciated :)

Edo

2073. Re: Reading SIDE B with the XF551

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-01 00:00:00 UTC
From: llpwhite@cs.com
Message-ID: <20000401150310.16011.00000468@ng-bk1.news.cs.com>
Source record: 45644

I have two brand-new Toshiba 5-1/4" mechs that unfortunately need the timing hole to read or format side B. I have checked with CSS off and on for at least two years to see if they had made any new Enhancers for sale. No luck so far, so I've given up on that route. But it made me think -- how does a 3-1/2" keep time since there are no timing holes? Flipping one of these upside down, there is a small device and what appears to be a very tiny magnet attached to the outside of the disk hub. My guess is it's a Hall-Effect sensor which would send a pulse each time the magnet cameinto proximity to the sensor. Anyone ever try transplanting one of these to a 5-1/4"? Dosesn't look too hard. Looks like you could also use a small switch to change to the H.E. sensor or the timing hole photo-transistor. Well, I've put that on my "list". Since you can buy 720K drives for $0.50 - $1.00 at ham/computer fairs, the parts certainly would be cheap and available.

2076. New BASIC Compiler for ATARI XL/XE 8-bits

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-01 00:00:00 UTC
From: Jeffrey Glen Jackson <jeff@jeff-jackson.com>
Message-ID: <LUzF4.403$fh2.71284@newsin1.ispchannel.com>
Source record: 45647

OK, it isn't that new. I finished writing it 15 years ago. Even sold it for a while, although it didn't sell a lot of copies. The 8-bit world was on the way out in 1985. But I recently resurrected the compiler and its development environment and have been having some fun enhancing some parts of it. Real nostalgia trip since I spent a large chunk of my free time at university developing this thing.

It compiles a unique BASIC dialect to a very fast p-code. The p-code interpreter and the Control Program (i.e., DOS shell) live in XL's shadow memory. The Control Program replaces DUP.SYS and provides a command line interface much like OS/A+ and DOS/XL from OSS. It manages loading programs (you can load multiple programs into memory at once) and libraries (modules can share subroutines with multiple programs -- shared libraries on an 8-bit computer!)

Anywho, if you want to check it out and play with it, check out my web page. Goto http://www.jeff-jackson.com and click on ATARI. There's a ZIPped XFD image of the object files and one of the source. I'd love to hear from anyone who downloads it and plays with it some. While I'm still in this nostalgic mood, I may even fix bugs and add enhancements for you.

You know, it boggles my mind, this is a complete development environment release that fits on a 180KB disk. The C++ compiler and development environment I'm about to release for the company I currently work for is literally 1000 times bigger. And let's not even think about how big the debugging version of said environment is. (Oh yeah, if you look at the source, keep in mind I have 15 years of experience now, and my coding and commenting style is much better now :-)

Yes, the SDX compiler was custom and did run on an MS-DOS machine. There
was no written documentation for it.

Hi Edward,

I don't think a fortress was involved. All I remember was that there were a lot of troops on the ground viewed from above and I think the helecopter could bomb them.

It scrolled up and down and I think you could control the movement of the troops but maybe i'm deluded.

Boosta.

The files are CFX.COM(5kb) and CD.SYS(2kb). Unfortunately the disk is
in 360kb format and although I would think a 1.44Mb drive would be backword
compatible, for some reason I can only get a directory. I think I will try
a reboot with a BIOS setting of 360k. Since you own the hardware and have a
right to the software, I will email it to you if it works. A second option
would be for me to hunt down a 5 1/4 drive for the second format included.

Yes, I've been trying to find the name, but it just wouldn't pop in. That's what I think it is too.

From: Cabell Clarke <cabell@richmSPAMNOond.infi.net>
Message-ID: <8c7ees$3u6$1@nw001t.infi.net>
Source record: 45650

I had one of these Amdek 3" drives in the mid-80's and could not find the disks for it then - I imagine they'd be really hard (if not impossible) to find now. But since the drive could be used to control external floppies (I had a couple of TEAC Quad density drives hung on mine), I bet you could figure out a way to change those mechanisms.

That is the game I was referin to. Fort Apocalypse is an anwsome game.
Too bad is it on tape. Takes a LONG time to load, but it is worth it.

That can't be right, if you posted the original message. First, Fort Apocalypse is viewed from side, and secondly, it scrolls more than up and down.

Hello,
I'm Edward Williams of The Arkansas Museum of Computing, I'd like to ask a
few questions of the 8-Bit Community.

1. Do you use a Real Atari 8-bit or an Emulator?

2. If you do use a Real 8-Bit would you be interested in new hardware?

3. If it we're available at a reasonable price would you buy a Hard Drive
for your 8-Bit?

4. How would you prefer it interface?
I. Joystick Ports
II. Cartridge Port
III. Processor Bus Interface
IV. SIO Port

5. Would you want a Hard Drive installed or User Installed Hard Drive?

6. And last the most important Question How much would you pay?
(a) $50-$99 (b) $100-$149 or (c) $150+

Thanks for your time
Edward Williams
Arkansas Museum of Computing

You want to make copies of data file cassettes? Play on one and record on the other. (which is how I used to make copies of Zaxxon 15 years ago, their ridiculous copy protection only made loading the game harder to do). The cassettes are audio. You might want to clean the heads on the cassette players, it don't take much to screw up the recordings.

Did you play the cart version of BBSB? If yes, it's likely your cart died
instead of the XL (have you switched on/off with or without cart?).

Bye,

Andre

2110. SID System... updated.

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-03 00:00:00 UTC
From: David Lloyd <dmlloyd@atari-central.com>
Message-ID: <Pine.LNX.4.10.10004031402480.9279-100000@saruman.ws.inxpress.net>
Source record: 45671

Well, this weekend I finished redesigning the SID PBI expansion. Now it will function (well, pending prototypes) as a proper PBI device. You can select the "ID" number using a selector switch. Also, on the PCB that I will be ordering (hopefuilly this weekend?), there will be one (or maybe two) male XL-style PBI header(s) for further expansion. The decode circuitry I made is capable of handling up to 16K of bank-switched ROM, and up to 4K of bank-switched RAM (not that I'll acutally *use* that much!).

The design now includes no less than *four* PALs: two 16L8s, one 16R4, and one 16R8.

The most recent addition is one 6522 VIA, for bank-switching control, timers (with interrupts), and a shift register which can interface to a serial-type mixer device.

There's now so many devices crammed in there that all but six bytes of the $D1 page are used up! Also, it is going to require an external 12 Volt DC supply, to prevent drain on your poor Atari.

My main worry is that this device is going to be very large... 8 SIDs, 4 PALs, about 5 or so miscellaneous buffers, 2 decoders, a whole bunch of op-amps.... I hope I can squeeze it all together with a minimum of noise!

I'm going to _try_ to offer both a high-level software driver (for playing MIDI files directly) and a low-level driver (for those who like to access the registers directly).

In all likelihood I'll finish the hardware design long before the software; but I will keep a current version posted on my website at all times once I begin work on it. For any who are interested, I will post a message when I have begun development on the software (I may design a MIDI interface first, for testing purposes).

Also, I will post the PAL listings as soon as I compile them (I'm waiting for a new monitor cable to come in for my PC before I can do that).

The URL for this project is here:

http://www.atari-central.com/hardware/projects/sid_system/

There's not much here, but there should be by this weekend: PAL listings, *maybe* part of the schematic, and *maybe* a hardware manual.

- D

quick back ground.

I have returned to atari 8 bit after many years away (I regretted selling my old 800xl +bits to pay for my first pc for university) Now I have been building a new collection. I have an 800xl, 130xe, 1010, 1050 and an 810

And now I have got my hands on something I only heard about before, an 850 interface. However, no manual, no power pack and no software!

so can any one advise me on a power pack (volt/ampage, pin or collar positive etc) Please don't say get one from a supplier as they tend to be US based and their power packs are NFG for the uk.

I found some online stuff re documentation, any idiots guides out there though.

was any software needed for it? I assume not (only for specific tasks/programs etc)

My eventual desire is to use it for pulling files off my PC (the games I used to play and love, utilities etc) which can be found on the internet, and establishing a modem connection to a unix shell account I have and maybe printer connection.

TVM, Jon-Paul

No I am afraid it is right. I did not post the original message. You
are correct in that the game does not just scroll up and down.

IIRC the R: handler loaded itsely when booting the 850 interface withOUT a disk drive; required the Autorun.sys when using a drive. Saw the manual on line.. will attempt to track down.

> 1. Do you use a Real Atari 8-bit or an Emulator?

After many, many years of using a real Atari, I had to give it up and am now
operating strictly in emulatiojn.

> 2. If you do use a Real 8-Bit would you be interested in new hardware?

I'm not using a real Atari, but I know that there are many who'd be
interested in new hardware.

> 3. If it we're available at a reasonable price would you buy a Hard Drive
> for your 8-Bit?

Hmmm. Good one. With BBSs disappearing, why would somebody get a hard
drive? Perhaps user group librarians or people with large collections of
software might need one. Programmers could benefit from one. But the
average user? Not sure.

> 4. How would you prefer it interface?
> I. Joystick Ports
> II. Cartridge Port
> III. Processor Bus Interface
> IV. SIO Port

I guess PBI would be fastest, probably followed by SIO port. The cart port
wouldn't be practical unless there was a way to pass a cart through, like
the old MIO-XE connector.

> 5. Would you want a Hard Drive installed or User Installed Hard Drive?

Again, this depends on who's using it and what their level of tech
competence would be.

> 6. And last the most important Question How much would you pay?
> (a) $50-$99 (b) $100-$149 or (c) $150+

Probably the stickiest question of all. You're bound to get a lot of (a),
and whether (b) or (c) is your final price might depend somewhat on how many
you sell. I think most people would balk at (c) but it might be the only
realistic figure.

The 850 uses the same power supply as the 1010, 1050, 810.
it is 9V ac at 1amp max. the 1050 and 810 PS are 9V AC at 3amp approx.
Does your 1050 PS have duel outputs?? the ones here in australia do.

As in comment well or get fired for not doing you're job properly?

As an aside, statistically, the vast majority of programmers who can touch
type also put in lots of comments as it takes them a second or two to do
but pays off later. Those like myself who do the 2/4 finger stab tend to
use rather leaner amounts of comment unless prompted.

Both, but emulator most of the time.

> 2. If you do use a Real 8-Bit would you be interested in new hardware?

I think just about any hardware add-ons one could want have been developed for the Atari. Most are just hard to find now. If you could obtain rights to some of the existing hardware add-ons (like the ICD MIO board) and make them available again, there might be some interest.

> 3. If it we're available at a reasonable price would you buy a Hard Drive

Corners it a bit => you probably have the Atari to PC RxD right.

I have to ask because there have been a number of people that have made this mistake in the past: Have you used the load ATR image from either APE or SIO2PC and assigned the image as drive 1? Neither APE or SIO2PC default to loading an image, so it is just like not having a drive if you don't load an image.

It has been a while, but I think both SIO2PC and APE have some diagnostics built in. There is a sub menu/option that gives a verbose indication of what is happening with SIO2PC anyway. You need to look for things like the command line transistioning.

Right now if I were you I would forget about pins 1-3, 7, 11-14, you probably have them right. Pins 4-6, 8-10, sound like the problems. Do things like check diode band direction. If nothing else, you can eliminate the 5.6k pull up resistor and cap to simplify the design a bit.

BTW: There are two types of color schemes used in Atari cables. The ones from Chelco have a different color coding. I have also just repaired an APE cable that had a broken line in it, so check for continuity just to make sure.

Hi,

recently I bought a VGA-801-A from Matco (a device to translate
composite video to VGA signal, costs new 69$). Yesterday I
connected my 800XL (PAL, no video modifications) to a multisync
monitor with it and I have to say its great. Although I used a
monitor (RGB) before, the picture is much better on the multisync.
Maybe I'll buy a second one as backup as I never again will be
satisfied with less.
BTW, the address of Matco is www.mat-co.com, they accept orders from
europe too, but postage to europe is quite high (I paid >40$).

Hello,
ask Bo and Ernest Schreurs about their Cas to WAV converter program...
quite interesting background story !! Besides, copying from (Hifi-)Tape
to Tape is easier and to a digital destination (like DAT, DCC, MD, CDR,
CDRW) is far secure (but wastes to much memory). greets- Andreas
magenheimer

P.S. Why not keep the cassettes as original source and use a disk-file
as backup... (if you own the original program, you are allowed to have
backups on any medium)

Hello Edward,
1) I own and use original 8Bit Ataris, like XL, XE and XEGS computers
and 1050(with speeder) plus XF551 and XF351 floppy drives...
2) Yes, new hardware sounds good, if there is also some software support
(software that uses it !!) Examples:
- sound enhancements (Pokey/Gumby, Covox, SID, AMY, other sound chips,
sound cards)
- graphic enhancements (more Antic+GTIA chips, other graphic chips,
graphic cards)
- peripheral enhancements (3,5" floppy drives, hard drive interfaces,
Zip drives, CD-Roms, etc.)
3)Yes, I would buy a harddrive interface, may it be SCSI or IDE...
4)I would prefer PBI (Parallel Bus Interface, standard on most XL
computers, with adapter also on XE computers...)
5) I would like to install my own harddrive (thus merely the
interface+software drivers would be needed)
6) without a harddrive, the interface should be avaiable at a price of
50-99 dollars ...
greetings - Andreas magenheimer

Hello steve,
maybe I am a little antiquated (aren`t we all - using Atari 8Bits) but
could you please pack the program, so it will fit on a 1.44MB diskette
?!? It is so hard to write onto a CD-ROM (no ZIP, Jazz, CD-R, etc.
avaiable here)... greets - Andreas magenheimer

What about hooking a Zip drive to the 8bit? That would probably give the longest lasting solution since as HD's go back they may not be available in the future vs there's ton's of 100MB Zip disks floating around.

I would prefer a SIO hookup since it would work with all Atari's. What are the advantages of having the PBI hookup vs SIO?

Does anybody have a list of ALL the Atari CO numbers?
The Best Electronics Catalog is great, but if I wanna look up a number (without knowing where the number or the part belongs to) it's as easy as looking thrue the phone book to find someones name.

(btw I did that once. I knew her first name and the street she lived in. Toke me 4 hours to find here.)

You don't need the missing signal. Just get yourself:

One "stereo to stereo" cable. (like the one you use to connect your amplifier
to your tuner)
One 5 pin DIN (Male) to 4 connectors "that plug into the stereo-to-stereo
cable"

You could buy a 5 pin DIN to 2 connectors "...." but one of the connectors is
connected to the wrong pin.

That's all.

> PS Schematic B shows part of the RGB circuit.

Mathy,
From what I understand, the CM8833 is equivalent to a Commodore 1084.
I don't have an exact 1084 (no suffix) manual, but have scanned schematics
for half a dozen Commodore monitors. From what I know, the 1902A is similar
to the 1084, and I have that one. Let me know if you want me to send you
the .gif files for the 1902A.

PS A friend is working on getting all my schematics up on a website. I'll
let everyone here on comp.sys.cbm know when it's ready.

(Wants to copy ATRs to disk, using PC).
The solution is to use a sio2pc or ape cable.
It is theoretically possible to copy a dbl density (180k) atr to a
disk using the pc. Most of the atrs you want to copy to disk are probably
single density disk images tho (90k) and that can't be done, essentially.

Correct, you don't NEED the signal unless you want a slightly better display on those great old C=64 monitors. The XL/XE's have only the video & audio at the jack whereas the earlier 800 had a two component video signal consisting of Chroma and Luminance. Check the pinouts here:
http://www.atari8bit.tmfweb.nl/pinouts.htm#monitor
and the video enhancement mods here:
http://www.redshift.com/~cdyson/atari.html

2148. Help with identifying CSS Operating System Upgrade

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-05 00:00:00 UTC
From: "David A. Paterson" <david_p@storm.ca>
Message-ID: <8cgodg$g9h$1@news.storm.ca>
Source record: 45611

I recently acquired an 800xl with a CSS Operating System upgrade installed. The daughterboard is marked (C) 1984, which makes me suspect it predates the Ultra Speed Plus OS.

There's a two position switch: in one position, it boots to the standard XL OS; in the other, it boots to a blank GR.0 screen, where I can type anything, but it has no effect. Booting with OPTION held down in the second OS takes me to the BASIC READY prompt.

I suspect the alternate OS is 400/800 compatible, with the "MEMO PAD" title removed (copyright reasons?). Does anyone have any info on early CSS OS upgrades for the XLs?

I've looked at the CSS website (www.nleaudio.com/css) but I don't believe this upgrade appears there... and I sold off my Antics and ANALOGs long ago.

Any help would be most appreciated.

Hello!

I’ve just bought a second-hand Commodore 1084S monitor which I’d like to connect to my 800XL. I’ve read in the FAQ there’s a certain signal lacking just on the XL computers so an additional hardware solution is required.

My questions are

1) What kind of cable should be used for the mentioned monitor?
2) What is the extra hardware I need? Should I rather get an XE to avoid that?

I wrote some stuff to process Atari 8-bit cassettes with a sound card.
Check my home page:
http://home.planet.nl/~ernest

It has the executables for the PC and the 'C' sources included.
It also has some utterly useless stuff we call documentation.
E-mail me if you have questions about it.

Keep those XL's/XE's buzzing.

After speaking with him, this is what I found out.

He currently doesn't have is 8-bit in his possession. It is back home in Colorado packed away.

I asked him if I could buy the rights to the program, but he isn't interested in making any more money off of DD3. I suggested making it Freeware, and he liked the Idea.. I haven't heard from him since.

If anyone interested in this, please e-mail him, you can get his e-mail address from his website, and let him know, that you are interested in getting DD3 in Freeware.. Hopefully he can get is 8-bit stuff back, and get DD3 back out.

Later all.

Marshall Walker

Hello,
try the program "Ataridsk" it works like a filecopier, so you can copy
from DD-Atari disks (180k) to the PC and vice versa (using the 5,25" PC
floppy disk!!). The PC program works best with DOS, with Windows you may
need to go into DOS mode. Just look at the attachment here... Andreas

Hello Steven,
well really all Ataris have SIO but it is rather slow...
PBI is much much faster (about ~5 times). Besides I think, harddisks
will live for some more time... maybe longer than ZIP disks will do...
greetings - Andreas Magenheimer

P.S.: Or was HD standing for High-Density disks ?!?
-It is true, they are dying away now...

Thanks for the advise guys.

http://www.atari-history.com/
and
http://www.pcc.net/dzone/atari850/atari850.htm

Proved very useful, also the FAQ files.

so currently its put to one side and earmarked for a 'later project'

so TVM

Looking at Wooley's IDE interface, building a simple one shouldn't be that
much of a problem. Bob added a ton of neat stuff like hard drive code and
multiple OS to the thing, but really there are only maybe 4 people in the
Atari world that could build the thing.

IMHO, and I think Bob has said as much, the entire implementation of the
interface could be done with a single 74LS138<?>. I am certain that as soon
as you start doing a MPD/PBI/ROM device, that leaves out 90%+ of the people
in the market. It is almost like magic, but as soon as you hit ~20+
connections people start screwing up, not to mention most people don't have
an EPROM burner.

Just guessing, but I would think that the combination of 50 pin edge card
connector, 40 conductor IDE cable, [programed EPROM, 74LS138, 40 pin IDE
header] and the PC board to hold them would run $40-$50 alone and you would
still need to add a power supply and case for the hard drive. PC cases and
power supplies are pretty cheap around here, $30 and $7 respectively, but
that means you are now at $47-$80 for the interface w/o a drive.

Another IMO, but I think the device can be hooked onto the PBI, but only
using a 74LS138 with 40 pin IDE header and loading the software to handle it
from a boot disk. This would lower the number of connections that need to be
made to the point where you could almost wire wrap each device and probably
keep the cost down <$40 if someone sell them and probably at least 1/2 of

the people that would want them could build them themselves.

I am a little more then disappoint that Radio Shack no longer carries their cheap edge card boards, but there are really high quality prototype boards that sell for ~$15 each.

2159. Atari 8-Bit Computers: Vendors and Developers

Or you can always ask me for a copy at mailto:mcurrent@carleton.edu

------------------------------

Subject: Introduction

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Major" PD/freeware/shareware developers should also be listed.
Persons or entities holding rights to products, but not selling or supporting
them in any way, are NOT listed here.

"Vendor" = Reseller of products produced by others. Types of products
sold are given in categories: new hardware, used hardware, PD/freeware/
shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the
developer are listed. No product can be developed by more than one
developer. No prices are given.
```

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair many 8-bit Atari and related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Super-Brief Copyright Primer

Commerical software - protected by copyright, may not be copied except for personal archival purposes
Shareware -protected by copyright, may be freely copied and distributed, shareware payment required for continued use
Freeware - protected by copyright, may be freely copied and distributed, no payment required for continued use
Public Domain software - NOT protected by copyright, anyone may do anything with it, period.

Software is protected by copyright from the moment of creation. No copyright notice is required for copyright protection. Software does not enter the Public Domain unless explicitly released to the PD *by the copyright owner*.

My article "Intellectual Property Protection for Computer Software" appeared in Atari Classics, 3(1), 1994, pp. 4-7, or see:
http://www.library.carleton.edu/staff/michael/acarticle.html

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

"Hi!" to Marek Tomczyk, who has supplied so much information from Germany.
"Hi!" to Alex Martin, who has done the same for the land of Poland.

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

2160. Another PBI question.

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-06 00:00:00 UTC
From: David Lloyd <dmlloyd@atari-central.com>
Message-ID: <Pine.LNX.4.10.10004061539520.12004-100000@saruman.ws.inxpress.net>
Source record: 45621

All right, hopefully someone has the answer to this one. :-)

In the Antic PBI articles, they discuss the contents of the PBI ROM. In the little table that describes the "ROM Vector Table" ($D800-$D81C), there are two bytes that are marked as follows:

$D803 ID Number ($80)

and

$D80B ID Number ($91)

Does anyone know what these numbers designate? Are they arbitrary? I couldn't find any reference to these ID numbers in the documentation anywhere. Also, what kind of checksum is performed on the ROM to arrive at the 16-bit sum stored in $D800 and $D801?

Any help is much appreciated.

- D

2161. Re: Help with identifying CSS Operating System Upgrade

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-06 00:00:00 UTC
From: "David A. Paterson" <david_p@storm.ca>
Message-ID: <8ciud7$1uf$1@news.storm.ca>
Source record: 45622

OK, here's a great reason to continue to support CSS:

I sent them a quick email and got an answer in less than 24 hours. Bob Puff thinks it's "The XL Impossible" and volunteered to look for docs for it - even though I'm not the original purchaser and it's 16+ years old.

That, my friends, is service. Try to get that from any modern vendors.

David P.

Source record: 45623

Steve,

I just got it running a few minutes ago, so forgive me if I simply haven't looked around enough to find this answer...

Is there a way to use my current APE registration to get rid of the unregistered wait? The machine I run it on isn't 'net connected.

Thanks,
Jeff

atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
find it hard to keep up with NewsGroups.

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want and E-Mail me the rest! To expedite things, include your complete
Mailing address so I can figure your Shipping/Postage & Handling. I'll
be back after the weekend.

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out
into Atari Jaguar Hardware & Games. So checkout what's new on my Web
Site. In Fact, check it regularly as my Catalogs are updated regularly.
Customer's are served, first come, first serve! No competing in
auctions. Just Sales, Support & Service! I have 8 different Catalogs, &
my SoftWare Catalogs are my largest. They have the biggest Byte Count.
You should see my inventory! I have TruckLoads of HardWare, Boxes and
Boxes of Software & Libraries of Books & Reference Material for the
Classic Atari 8 Bit, Atari ST & Atari Jaguar Game Machine! And
remember, if you can't come see me today, come see me tomorrow!

Click for WebSite!

You're memory is faulty. You cannot reliably use a 1.44 disk as a
720. Not now, not then.

I second that. Let's make OSS supercart support on Atari800Win easy
and effective. It sure is frustrating having to deal with the real
Atari for compiling and disk file issues after using a more modern
system.

You seem to speak on Mike's behalf a lot. What is your motivation?
Let Mike speak out for himself. I'm sure the second he does anything
official in court, his current address will be made known to all
concerned immediately.

It's almost like he gets to let people down and hide, but the second
anybody even hints at doing anything that might not be in his best
interest, you are there to be his advocate. Does this keep you in his
good graces so that you are one of the few to be able to deal with him
on stuff?

I understand that Mike maybe bit off more than he could chew once upon
a time. I understand that even well intentioned things can go wrong.
I can understand that just because he short changed some people, that
doesn't mean you (or anyone else) are obligated to shun him. What I
DON'T understand, is why you personally, so dilligently serve as
advocate for him so often.

It doesn't seem right that Mike gets to "hit and run" but is protected
(or at least is attempted to be protected). One should walk the walk
if they talk the talk. One should not throw stones if he lives in a
glass house. God it's frustarting to have such cool software tied up
in la la land because the guy who owns it is in hiding. No! Don't
anyone dare infringe Mike's rights and make use of X and whatever
else. Yet, because Mike ripped people off he is in hiding and cannot
/ will not provide some of the few remaining gems of the Atari8 era in
its (what I believe to be) final days. It really is sooo sad. Think
about it.

Bob, you seem like a generally decent and stand up kind of guy. I
know I have admired your contrubutions here and to the Atari8
community for as long as I have been in this ng. We all know by now
why Mike isn't there when things come up related to him. What I for
one would like to know is though, why you are always there whenever
anything related to him comes up.

For sale, continental USA only:

I have a box of both working and non-working Atari
8-bit hardware, including an 800XL, 600XL, 400?, a
printer or 2, a couple of SX212 modems, etc,...

Want to sell entire lot, for $25.00 plus S&H.

Misc. multiple cables also...

Must sell - need room - 7 days, and if not sold
its deep-sixed... ;-(

Thanks! ;-)

PS My news server sucks vacuum hard, please reply
by E-mail if interested.

2171. PhillyClassic Classic Gamers Event 4.7.2000 UPDATE

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-07 00:00:00 UTC
From: David Newman <davidnewman@adelphia.net>
Message-ID: <38EDB83C.4342F422@adelphia.net>
Source record: 45632
Cross-posted to: comp.sys.amiga.games,comp.sys.atari.8bit

Hi everyone:

I know that *some* of you know about this event already, but I just wanted to give everyone an update (or an introduction, as the case may be) to what is shaping up to be a terrific event coming up April 15, 2000. If you have any questions, please feel free to email me. Or if you have some cool classic gaming items you'd like to bring and do a session on (even just an informal show'n'tell kind of thing), we'd love to have your participation. Or bring your goodies for sale or trade. Or just come, play, browse, shop, and meet some fellow gamers and collectors.

** PhillyClassic, Philadelphia's first annual Classic Gamers' Event! **

FEATURED GAME PLATFORMS include: *ATARI 2600* 5200 * 7800 * 400/800/XL/XE COMPUTERS * C64 * AMIGA * COLECOVISION * INTELLIVISION * VECTREX * DREAMCAST * PSX * N64* JAGUAR * SEGA * NES * plus a few surprises!

** UPDATE: 4.07.2000 **
Prepurchase ticket deadline extended to Wednesday April 12. PLUS, we just received a donation of a terrific new prize that all attendees will have the opportunity to take home with them - an ULTRA RARE Atari 2600 Berenstain Bears Kid Vid game set, kindly donated by John Hardie of Atari Gaming Headquarters (and the organizer of Classic Gaming Expo 2000 coming up at the end of July!)

We're going to have every classic system set up and ready for play. Tournaments on the Galaga arcade machine, 2600 Warlords, Atari XE Defender, and more modern multiplayer fun are also on tap (Dreamcast, N64, etc.) Ya like HANDHELDS? Come and see an AdventureVision, SuperVision and some dedicated handheld electronic games from the '70s from Coleco, Mattel, Entex, and others.

Want to buy Vectrex and Atari 2600 multicarts at a *discount*? Want to shop, swap, browse, schmooze? Want a cool Atari 2600 cartridge keychain? If you answered YES to any of these questions, please send in your ticket orders ASAP. We've sold over 20 tablespaces already and time is running out. Please visit the official web page for details, driving directions and interactive maps, schedule of events, continually updated information, and some HOT classic gaming links.

http://members.aol.com/davidn9000/philly.html

People are coming from all up and down the east coast - NY, CT, PA, NJ, DE, MD, even Canada! We also have a number of dealers coming, so there will definitely be a cornucopia of classic gaming goods available for sale and trade. Only 8 days til the classic gaming world comes to Philly - will YOU be there?

Here's a sampling of what you'll have a shot at winning as either door prizes or tournament prizes:

* 3 Missile Commands for PSX (donated by Hasbro)
* 3 Space Invaders for N64, GBC, and PSX (donated by Activision)
* Asteroids for PSX (donated by Activision)
* Intellivision Collection for PSX (donated by Activision)
* 6 NEW revision of Ed. 5 Digital Press Guides (donated by Joe Santulli of Digital Press)
* 3 copies of Leonard Herman's book "PHOENIX: The Fall and Rise of Video Games"
* Verrrry cool AdventureVision logo T-shirts donated by Jeff Folejewski of AdventureVision.com

AND MORE STILL TO COME!

Website has complete details, including
* Information/scheduled events
* Hotel accomodation info/online reservations
* Door to Door driving directions and interactive maps
* Ticket information
* How To Link to Us banners/ads available for YOUR classic game related site!

http://members.aol.com/davidn9000/philly.html

** UPDATE: 1.31.2000 **

TNT Amusements, a local coin-op vendor is bringing a Galaga coin-op for a Galaga tournament!

** INITIAL POST: 1.28.2000 **

Hey all! I'm here to announce the first annual PhillyClassic East Coast Classic Gamer's Event. We are organizing an event to bring classic gamers together as a group for a weekend of trading, selling, and storytelling!

The weekend of April 14th, 15th, and 16th will be one to remember as classic gamers unite for a weekend of hardcore gaming! Planned events include casual trading/selling, *tournaments*, *auction*, show-and-tell, and a general good time by all!

We have rented a conference facility at the Villanova University Conference Center for the event, which means enough room for a lot of people to come and setup the pride and joy of their collections, and even a little tradebait!

The conference center is COMPLETELY PRIVATE, has security, and plenty of FREE PARKING.

The tentative times are as follows:

Friday: 7pm - whenever -- Setup Night/ meet 'n' greet/ informal gaming/ early bird trading

Saturday: 10am - 7pm (will probably go longer) -- MAIN DAY

Sunday: 9am - noon -- Packup, Final Goodbyes

If you have any questions or would like to help organize a part of the event PLEASE e-mail David Newman (davidnewman@adelphia.net) or Chuck Whitby (intv-sama@worldnet.att.net). If you plan on attending, please purchase your

tickets early and make those hotel reservations!

Thank you very much!

If it is "The Impossible" isn't that the one that requires a cartridge to
make a backup of copy protected disks? I seem to recall it was like "The
Pill"<?> in that it used RAM to store the copy protection.

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

Atari 8-Bit Computers: Frequently Asked Questions / Michael Current

Hi Ernest,

What would be the process involved in getting executables from
an ATR file into CAS format?

Many thanks.

To convert an ATR to a CAS format file you would need some conversion
program. It is not clear to me what you are planning to do though.
There are ATR files which are in fact bootable disks. There are also
ATR files of DOS disks that contain files. In theory you could
convert both to cassette image files. But then you would need to
convert the bootable ATR's to bootable cassettes, adding cassette boot
code. If you have a DOS disk, the easiest would be to extract the
files with a utility like XDIR and then convert the .com or .exe files
to cassette images, and then use the binary load from c: from the
DOS menu, or convert them to bootable tapes. Either way, you
need to have some knowledge of how the boot process works.
The format of the cas files is not that hard. Including the boot
loading code would be the hardest part.
If you want to discuss this further, you can send me an E-mail.
I currently have no time to write tools like that, so anyone who
feels up to it is welcome to do so.

My 'Mapping the Atari' Revised Edition in Appendix 12 also lists the
table of PBI addresses with $D803 as $80 and $D80B as $91. It appears
from this table that these values are always there, but there is no
actual text that says this is true.

Could this be the way that the Atari 'finds' the PBI device ROM? IOW, if
these values aren't found, the Atari assumes there's no device?

Also, the book lists the checksum as 'optional'.

I am just guessing. I've never played with the PBI.

Hello there!

I recently got an Atari 65XE and I'm looking for a BASIC manual.
What I would like to know is, are there any available online or should
I try to order one from one of the suppliers.

Also I would be very interested in getting hold of an Assembler/Editor
Cart if anyone has one for sale.

Many thanks.

Boosta.

2187. Re: Another PBI question.

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-08 00:00:00 UTC
From: Atari Bob <ataribob@mindspring.com>
Message-ID: <8coiq1$ff2$1@slb6.atl.mindspring.net>
Source record: 45550

The OS selects the PBI ROM and reads these ID bytes to determine that a true PBI ROM is there. If it does not find these bytes, then it assumes that there is no PBI h/w at that location. If it does find the ID bytes, the OS jumps thru the init vector in the PBI ROM - this all happens during the OS boot and init routines.
You do any kind of checksum you want - nobody in the OS ever looks at it, actually.

Bob

2188. LCD displays

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-08 00:00:00 UTC
From: Richard Cortese <ricortes@netmagic.net>
Message-ID: <sf000qd4cqv119@corp.supernews.com>
Source record: 45551

I don't know if this is relevant to anyone, but my son kind of provoked me into doing a LCD project based on the Hitatchi HD44780 2x16 module.

It is one of those good news/bad news things. The good news is the modules are available in surplus shops for ~$4 each and they are a breeze to interface. For the module I used, it only required something like 12-14 connections and that includes ground, power supply, and contrast. There is a lot of documentation for them scattered all over the net, if you just use the part number in a search engine you will find a lot of schematics.

The bad news is multiple: I checked out the cost of new ones, I would say prohibitive, ones like a 4x40 he bought for $4 cost $60-70 new. I did the project for an IBM printer port. Of the 3 schematics I used, all 3 had errors so I had to go best 2 out of 3 to decide what to do.

I didn't bother checking out the 4 bit parallel load, only used 8 bit, but the things could be readily adapted to an Atari 800 though the JS and I would guess could be done using an XLs 2 joysticks.

He needed the display for a remote MP3 player he is putting together for his car. He wants to mount the IBM clone in the trunk and have the display on the dash. I must say the effects are kind of neat, scrolling display, predefined + 7 redefinable characters, etc. But really I don't have an Atari application I need them for.

Other thing I am kind of looking into. He bought a few of those HP 1 3/4" hard drives for $2 each. He thought they were 121 megs, but turns out they are only 21 megs so the gave me one to experiment with. Damn things are sooooo cute, about 2" sq and 1/3" thick. Bad news is I set it down on my work bench and it is so small I can't find it!<grin>

How about ï¿½50inc del(UK) for this lot ?

Atari 800XL with Atari 1050 5.25inch floppy drive, Alphacom 42
thermal printer, about 10 cartridges including Frogger/Pole Position
and Q-Bert, plus 50 or so 5.25inch floppy disks with case (loads of
stuff on these), 4 Atari basic programming books, Joystick, All leads
and power adapters, even spare rolls of paper for printer. All fully
working and can be seen working. Coventry area if interested in
collecting.

Thanks to everyone who has replied. I did find the source I was looking for (Ernest Schreur's homepage). I have Atari programs on tape I want to make a permanent copy of. This technology actually also works for a number of programs I have on handheld devices of the past that used cassette players to save/play programs in Basic. Cassette tape is not a reliable medium. And believe it or not, some of those handhelds are still superior in raw programming capability and number crunching to the current wince lot.

If you can read the boot sectors and not the rest, it means the sector size is set to $80 in DBYTLO/HI. Change them to $0100 and things should work.

FWIW I always preferred to ignore DSKINV and just use SIO. There are some things that just can't be done via DSKINV, such as format in 1050 density, so I figured I'd just eliminate the middleman.

From: Atari History Webmaster <webmaster@atari-history.com>
Message-ID: <38F26323.ECDC05F0@atari-history.com>
Source record: 45493

Hi everyone,

Doing some cleaning and sorting of duplicates of things I have and I put together a complete set of boxed Atari XL items including an 800XL, 1050 with 3 brand new DOS 2.5 diskettes, 1020 plotter, 1025 Dot Matrix printer, 1027 Letter Quality Printer, 1010 Tape recorder and AtariWriter software, everything is in original boxes. A nice starter set for someone looking to get into Atari computers or a nice collection of equipment for a vintage Atari computer collector.

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=304047885

Another auction I am running is for a 1200XL setup including monitor and a very rare Amdek Amdisk III which includes 10 3" disks including an original OSS DOS XL boot disk, for those into collecting, this is the system for you!!!

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=304525070

I have a lot of other Atari computer, non-Atari related and Atari video game items up for auction, so take a look at my other auctions and see what else is available.

Ok, any other distribution method besides alt.binaries.comp.atari8bit
(my news server, newsguy.com, doesn't carry it).

2209. Resident disk handler

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-10 00:00:00 UTC
From: rhamiiton5@aol.comedy.com
Message-ID: <20000409205458.17633.00000775@ng-fo1.aol.com>
Source record: 45568

The 8-bit resident disk handler ($E453) will read any sector (1-1040) on single or enhanced density floppies; it will also read (1-3) on a double density diskette. Am having considerable difficulty trying to read or write 256 byte sectors; is this beyond its capabilities? Is SIO ($E459) the only means to access them?

thanks

-Ron

I don't have a solution but I admire the problem.

2210. Replacement mechanism for XF551

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-10 00:00:00 UTC
From: mb@gem.win.co.nz
Message-ID: <Fss25y.oE@gem.win.co.nz>
Source record: 45569

A member of our local Atari club has the following question about his 8-bit system. As there are not many 8-bit users in the club I hope someone else may be able to offer some advice.

He has an XF551 5.25" disc drive which he uses on his 8-bit machine. The disc drive mechanism is wearing out. I have heard that standard 5.25" mechanisms such as were used in IBM PC compatibles can be used in the XF551.

We would appreciate any advice as to which mechanisms are suitable, whether any modifications are required or any other relevant information.

Thank you.

Ron.
No, SIO can read/write 256 byte sectors just fine.
I've just been messing with reading raw sectors for a SpartaDOS thing
I want.
You just set up the device using page three.
You have Mapping the Atari. $300 (dec 768)
ddevic- don't mess
$301- DUNIT 1 to 4
$302- DCOMND dec 82 read, 87 write
$303- DSTATS 64 read, 128 write, also read status after call seems error
is in 195, if other than 1 after call to $E459
$304-305- DBUFLO/HI put where you want the sector data to go.
I just DIM a BUF$(400) and then get the hi and lo of
BUF$ from ADR(BUF$) in BASIC.
$306- Time out, not too important, maybe
$308-309- bytes to transfer, LO, HI as always.
$30A-30B- Sector number, again LO, HI

once that's all set up, just do a USR to $E459. with BASIC, you must
have a PLA or two, I forget. Then a RTS. Oh, shoot. it's just a 3 or
4 byte string. Like X=USR(ADR("Lvdxx")).
Luck.
Russ
(I'm making a count the bytes on the disk/directory, seems we always
get free sectors, but I want how many bytes the files are.)

You will have sucess if you first load $02D5 and $02D6 with your sector
size info, then call $E453. This is for XL/XE only? But is referred
to on page 208 of Mapping the Atari, XL/XE version.

They can be pretty expensive, though if you track down the models without backlights, they're somewhat cheaper. Still, a new 4x40 is pricey. There are lots of manufacturers of these boards, and thankfully, the connections are nearly identical for all. I've done a couple projects with them, nothing really fancy, but I found you don't really need to bother with read strobe- as there is rarely a need to read from the device.

For low light conditions, the to use are the LED backlighting- which is the most expensive of course, but its easy to manage (plain +5 vdc instead of the high voltage AC EL or CCFT backlights).

The really nice thing about these displays is you don't need a negative voltage supply. In addition to the +5 logic supply, many lcd panels want a -5 to -20 vdc LCD bias, which can be a drag to come up with.

Apparently you can do all sorts of fun things with them like download new character sets to do pseudo-graphics. I did some basic cursor positioning on one driven by an 8051, it works pretty well and the interfacing is very easy.

The chipset has been around some time, the venerable Radio Shack Model 100 used the Hitachi lcd controllers for its display.

The 800 had "real" keys, so maybe that's either A) an 800 in a 400
case, B) a re-released 400 with the 800 keys, or C) freaky.

2225. Re: LCD displays

Source record: 45584

The datasheets for the units often give hints of varying quality. Essentially you create Atari-style character bitmaps (each characters is an array of 8 bytes- bits forming columns, bytes forming rows, giving a 8x8 bit matrix (or is it 5x7...); set the bits you want "on" clear the ones you want "off"). Then load them into the controller with one of the commands, enabling a ram character set and replacing the default character representations with yours. If you replace characters not "normally" used, then you print normal text and these special characters as required. If you're clever you can do all sorts of animation or effects. These lcd panels aren't suited for "real" graphics as the character cells & rows are normally separated from each other by a pixel width or so- which leaves gaps in whatever neato graphic you produce.

As Richard did, do an internet search. Interfacing one of these units to a PC printer port is a classic demo project. As you search around, you'll probably end up finding links to the chipset manufacturer, it will be helpful to download the datasheets- which are the best reference for operating the devices.

Here's two sites. I didn't bookmark the commercial/new LCD panel <$67> site,
but if you find it, they have all the data sheets in Adobe Acrobat .PDF
format and Acrobat viewer is a free download.
http://pluto.spaceports.com/~mpdj/
http://home.iae.nl/users/pouweha/lcd0.htm

As Greg said, they are all the ~the same interface. Either 14 or 16 pins,
with the first 14 pins always the ~same. Errors I saw were mostly simple,
things like tying the contract control pin to +5 volts instead of ground,
having the data pins shifted one pin over from where they should be, that
kind of stuff.

All the addressing and features are accessed through software. They have
register selection in a manner similar to Atari chips like the pokey sound
registers and timers, but with functions like placing a character Z onto the
screen at X,Y.

My son says he has seen people with trunk mounted PCs using 8' printer cable
to mount the LCD panel on the dash, so they much be pretty good with regards
to noise immunity.

Some time ago I ran a 6' cable driving 2 displays in my car and didn't have trouble, I sort of suspect the key is keeping the i/o rate low. The CMOS drivers will tend to soak up some measure of interference because of their low output impedance- but it is pretty impressive given how much electrical noise cars make.

It might be easier to run 2 lengths of cat3/cat5- certainly cheaper than 8' of ribbon.... but I've no real idea... ;)

By any chance, did your program have Atari EOL characters? If you
convert them to CRLFs and paste the program into your message it should
look better, unless it uses ATASCII graphic characters. If it does, you
may have to attach it.

2230. Newbie Vanguard Question

Yes. Yes. No that I know of. Yes.

;) Actually its a pretty good port of the arcade game to the Atari, even down to the background music. I imagine you can find an atr image in all the normal places

(http://shell.ihug.co.nz/~aaronat/atari.html for a start)

I've not tried it under PCXformer or Atari800Win, but I think it should work OK.

Well yes and no. When I bought my 400 it had the membrane keyboard.
There was a company that sold a keyboard that could be install in place
of the membrane one. That is what I did and to this day it still works
great.

I have a copy of the original disk (with copy protection intact) made with
Happy Backup many years ago. Great program. "He" starts to get really
angry when you insult his "mother" in certain ways. Her name, if I recall
correctly, is "Sylvia Atari". And of course telling him to "go away" is
good for a laugh, or to "kill himself" ;^)

>I also remember that there was an X-Rated version with stronger language.

I've never seen that one. If anyone has it I'd love a copy (in genuine 8-
bit useable format, or ATR).

I guess I missed the point of the question, actually.
I never heard of any use for $E453, except to do a status check,
often for copy protection to see if a bad sector is there.
I never heard of read/write with DSKINV.
I'm wondering why you want to do read/writes with it.
But someone already gave a good answer, whatever you do with
SIO, you need to put the bytes to read/write in DBYTLO/HI.

>I never heard of read/write with DSKINV.<

In the early days, DSKINV (and not SIOV)
got most of the media articles. So if you gave a quiz, I suspect that more
people would recognize $E453 than $E459 Remember David Small's 1982 Creative
Computing article on direct disk access? I remember having problems early on
with DSKINV trying to do write-without-verify. And I had a dickens of a time
finding any info about SIOV.

I was under the impression that Questron was bugged for the Atari 8 bits
anyway. I may have the name wrong, but I thought it was Questron that let
you get ~90% of the game completed and then bombed. I bought the game on
sale at San Jose Computers, had the first copy bomb so bought a 2nd copy
thinking it was a bad disk. Second copy bombed in the same place so I
finally bought the ST version.

Message-ID: <38F3ED26.C231776D@atari-history.com>
Source record: 45508

Hi Tony,

Alan Reeve, the programmer and owner of Diamond OS made the software freeware for everyone to use. I worked a small bit with Alan on Diamond OS and did the revised icons for Diamond OS version 2.0 (made the filing cabinets into little XF551 disk drives and redid the garbage can) and did a lot of beta testing. I have all of the disks with every revision and also Diamond Write, Diamond Paint, Diamond develop. Alan made several attempts to get Atari to package it with the XE computer systems since the OS looked just like the low-res mode of Atari TOS for the ST's. Atari gave him the run around for a long time and in the end he sold the software through a publishing company. Diamond OS was a great OS and never really had its chance to have any 3rd parties develop software for it (I think it was Antic magazine that did a review of Diamond OS and had it on the front cover along with a type in program to add a background color changing accessoriy) and for it to take off like it should have. As long as Alan has no objections, I'd be happy to make a section on the Atari History website with some history of Diamond OS, screen shots and downloadable images of the diskettes as well as the Developers documentation. I know Lance at Video 61 would love to be able to make Diamond OS carts, however they use the ICD bank switching boards so that may never happen unfortunately, but then again I never count Lance down, he's manage to produce in cartridge format a lot of software that he has received rights to that noone thought would be able to be made into cartridge format. The older Diamond OS (version 1.0 and 1.1) will work on an Atari 800 and up, however 2.0 and 2.1 require an 800XL/130XE to run.

If anyone wants copies of the diskettes I could run off a few copies, you just have to pay a few dollars for postage and send me some 5.25" diskettes. I can make the documentation available on the website, you just have to give me a week or so to take the time out to scan everything in and make a new webpage.

Curt

Okay, I remember I used to play it to death years ago. It was a sci-fi SSI RPG with incredibly simplistic graphics (used ATASCII a lot as I recall), not much in the way of sound, but had very solid, addictive gameplay. You were able to travel between planets, fight battles in turn-based battle mode, buy weapons and armour, and your party could consist of 4 (6?) players that could be of a variety of alien species. I don't remember much about it beyond that; it was long before Wizard's Crown, Eternal Dagger -- more like around the Phantasie I era or earlier -- early 80s, anyway. I think the game was either 1 or 2 sides -- not the larger 4 sides that later SSI games took up. Not much to go on, I know, but I havn't seen or played the game in well over a decade. I've gone through my entire Atari image collection (which is pretty extensive) and I'm pretty sure I don't have it -- I'd recognize the name if I saw it.

Anyone know what the hell I'm talking about? Even better, anyone know where disk images of it might be found if you do? Thanks!

2255. PC Keyboard on my XE

>The 8-bit resident disk handler ($E453) will read any sector (1-1040) on single
>or enhanced density floppies; it will also read (1-3) on a double density
>diskette. Am having considerable difficulty trying to read or write 256 byte
>sectors; is this beyond its capabilities? Is SIO ($E459) the only means to
>access them?

Depends on the Os release. The XL release DISKINTERF is able to read larger
sectors, there are two variables in page 3 to change the sector size.
Unfortunately, I forgot the addresses. The Os A can only handle 128
bytes/sector as far as DISKINTERF is concerned, but SIO will work fine in
either case.

So long,
Thomas

Sounds a little like Ultima 3 or greater.

OK, so I never actually solved Ultima 4, having gotten to the final step of the game 3 or 4 times before getting sick of it. Does anyone remember the final puzzle, or what happens when you finally get it right? An Apple friend of mine had similar trouble, so he sector dumped the game disk to get the solution- but couldn't remember either.

Yes, I have it also - with software.

> Are
> there programs available for it for the Atari?

Yes, on cartridge - maybe on disc too, which I have never seen. The carts
are usually hard to get, especially with overlays and manual/box. As far as
I know there exist 7 different programs for the chalkboard.

Hope this helps,

Andre

BASIC is either on a cart or can be enabled/disabled on later models. The
BASIC probably just means it is a BASIC program so run it with the cart
enabled.
Skew and Happy are probably both refering to a Happy modified drive. Drives
like this were modified by replacing the drive's processor and RAM so it
could defeat copy protection schemes. If you don't have a working Happy
drive, the software is pretty useless.
Translator puts the 800/400 OS into a later model 8 bit, like an 800XL for
example. About the same story, there were only 1 or at most 2 programs I can
think of that were used to pirate carts. The most popular one was ~CARTCOPY
and it used illegal calls to the OS so in order to run the pirated software
you needed to run a translator. There were really less then a dozen titles I
can think of that weren't compatible with the different OS. All the claims
about the XL series not being able to run 90% of the software really just
meant the clown making the claim had pirated 90% of his software.

You get the answer from "The Time Lord" at the bottom of one of the
dungeons. I can't remember it offhand either, but I think it is something
like [love, death, sun, moon]. You just insert the cards you have picked up
in the right order into the computer<Exodus> in the right order and it blows
up. You only need 1 live character to complete the game, so you get 4 shots
at getting the order right.

I think Exodus computer was Ultima 3, Ultima 4's final scene (at least the last scene I got to) is at the bottom of a very deep mine. The characters had to be pretty robust to make it down there, but at the final step you have to give the right answer to some question or other to proceed else get transported all the way back up to the surface. The problem is of course, that you can't save the game while in a mine. This had all the Avatar stuff- each character had to develop morality, spirituality, etc.. and be anointed in various ways before becoming an "Avatar" of some virtue. I don't think U4 had space travel (which I only remember from Ultima 1 or 2), but you could fly around in a hot air balloon. My college roomate and I spent uncounted hours hacking away at developing those characters.

7 programs soubds about right. I gave mine to the salvation army store when
I was moving a couple of years ag0. It was big and frankly was not that
accurate nor well supported. The much smaller Koalapad was better supported
and did pretty much the same thing if you were just interested in drawing.
I still have the Koalapad. ith a couple . The overlays, were a nice idea,
but they were fragile, probably expensive to manufacture (and certainly
expensive to package for sale) all of which relegated Chalkboard to the 'large
drawing tablet' market where it failed to match up to the Koalapad.

Hello tony,
besides some little problems which might occur when programming
something for a mouse there are quite a few programs avaiable for it. I
collected about 2-3 PD disks with software supporting the mouse and
there are also some commercial programs avaiable for it.
A few examples: 1) Tools:
- Diamond GOS, GOE/GOS, SAM and other XL desktops,
- some graphic converters from poland
- some PD calculator programs
- some game/level construction kits
etc.
2) Games:
- The Brundles (Lemmings clone)
- Bombdown (minesweeper clone)
- Minesweeper
- Operation Blood I+II (Operation Wolf clone)
- Geisterschloss (action game)
- Shanghai (from Activision)
- Missile Command (from Atari, use trackball mode !)
etc.

As you can see there are quite some programs avaiable, some commercial
stuff and even some PD software. Unfortunately there has not been a
standard for which port to install the ST-mouse, some programs use port
A, others use port B... greetings - Andreas

That was a reply to a guy asking for help on SDX cartridge access but the server bounced my email to him. I've sent you a separate email with the info. It's in MS-DOS text format and uses the line graphics characters, so if you don't use MS-DOS you'd probably best copy it to a printer set to use the IBM Character Set I (or II).

It will work, with a few problems:

1. You will not be able to detect the right mouse button without a hardware modification to the mouse (the left button will register as the joystick trigger).
2. It is very difficult to read the mouse movements properly; You have to poll the joystick port hundreds of times a second, which means you will need to write the handler in assembly language, with about 20 display list interrupts all the way down the screen.
3. Very few applications support it (Diamond OS comes to mind)..

I wrote a little utility to move an arrow around the screen with a mouse. I couldn't test it but Bill Kendrick had a mouse and told me it worked at his end :)

>A friend has a disk called Happy 7. Someone told him he needed a drive
>revision to use it. Can anyone give him a short explanation of what this
>is?

Happy is a modification for the 810 and later the 1050 drives which could duplicate many of the protected diskette programs of the time. It involved replacing the controller chip and also added some RAM for track buffering in the drive. That Happy 7 disk is the software which utilizes the hardware. BTW it can read/write PC SSDD 180k floppies.

-Ron

I don't have a solution but I admire the problem.

> little notes beside the filenames like: basic, skew, happy, translator needed
and
>a few other things.

BASIC meant put the cart in the 400/800 or enable the built-in ROM for XL/XE.
Skew referred to a custom track layout for Happy & USDoubler drives which
increased read/write speeds on their drive; most stock drives could utilize
these disks but were slower than normal.
Happy might mean it is clone of the protected disk and would require a custom
drive to duplicate; or possibly that only a custom drive could boot and run it.
Translator means you need an 800 or 800 compatible OS in the XL/XE. Atari
provided one on disk and several firms sold software or hardware for this
backward compatibility. One or both of the 8-bit magazines printed
instructions for making a software translator by copying an actual 800 OS to
disk and loading it into the RAM under the XL/XE OS ROM. Many XL's of that day
had switches to enable the proper hardware ROM at boot time.

-Ron

I don't have a solution but I admire the problem.

Nope. Actually, I think I just remembered it this morning on my way
to work. I think the game I'm thinking of is Galactic Adventures. I
could be wrong, but I'm going to have to see if I have the image and
try it to see if it's the one I'm thinking of.

Yes. It plugs into the Joystck port. I think you can address it
through the Paddle(0) and Paddle(1) commands (in Basic) where (0) is
the X axis and (1) is the Y. It's been a very long time, but I think
that's correct. Not much uses it tho... DiamondOS I think is one of
the only things that does.

Okay, I think I know what the game is -- I believe it was Galactic Adventures by SSI. Unfortunately, upon a check of my collection, it seems I don't have the game. So, now the question becomes: Does anyone have ATR/XFD/DCM images of these old classic?

Shame, that is. Well, at least now I know what to look for, so I'm
going to see if I can hunt it down. I don't know how easy that will
be; I've mirrored the entire Closer to Home archive, in addition to
maintaining my own archive, and have been sent another person's
collection from the UK on CD, and none of these sources have the game
on it.

Check out "MOUSER" from ANALOG magazine. It was one of the first demo's of using the mouse, but basically, it was just a demo. Also there was a quite complete mouse system that appeared in PAGE 6 /New Atari User. The same thing also ended up in Atari Classics. (Looked it up) It was Multi-Mouse, with much documentation on disk. In fact, the program and doc takes up pretty much a whole SD disk side. Wouldn't surprise me if it is not somewhere on the Pool Disk(s).

Hey Greg!

Ultima 2 had Space travel.

Ultima 3 had the computer and 4 cards

Ultima 4 required the Avatar to travel into the Abyss and provide the 'key' to win. I spent 3 hours getting to the bottom of the Abyss only to not have the 3 parts key in the right order. I didnt retry until 10 years later when someone posted a solution on the Web :). They actually have deatilaed maps on exactly where to go (You still need to fight though!). It took me 45 minutes with the map.

Yea, I own the mail server and some porn email list junk started coming into my mail box so I had to turn it off. I forgot to reset in the News Settings. It works now. thanks. Funny thing was the list admin denied pulling my email address out of this news group, here is the only place I use it. So I mailbombed her account with 10,000 emails an hour for 8 hours, that'll fix them.

>and did pretty much the same thing if you were just interested in drawing.
>I still have the Koalapad. ith a couple . The overlays, were a nice idea,
>but they were fragile, probably expensive to manufacture (and certainly
>expensive to package for sale) all of which relegated Chalkboard to the 'large
>drawing tablet' market where it failed to match up to the Koalapad.

I had an Animation Station tablet way back. I liked it, except for
the fact that the plastic grid overlay that covered the actual sensor
surface eventually developed a bubble off to the left side of the
tablet, making it exceedingly difficult to draw anything on that end
of the tablet. :-P Still, it was nice while it lasted, and I think
RAMbrantd even supported it.

Whuzzzzzzzup :P

I think I kept printed copies of the final solution maps???? If you cant find it and are around B-ville I could shoot you a copy(or email me your home address)

You get to see some pretty pictures and a message as I recall??

If you do a search for Ultima on Yahoo you'll find one of the Dragon sites that should direct you to a walkthrough.

The walkthrough I used had pictures of the war rooms and overheads of the dungeon levels (made walking very easy).

Good luck!

Hi everybody!
I'm about to open a new cool site that will be dedicated to
the original disks/tapes that used to be found in the computer packages
of the 80's (Like Amstrad CPC demonstration tape, etc..)

If anyone has a disk/tape image of one of the following machines, then I
will be gratefully pleased.
Please Send them to me by the following e-mail at the end of the post, or
send me a link to them.

Computers:
Amiga,Amstrad,Apples,Atmos,Oric,Machintosh,Spectrums,C64,C128,Atari ST,Atari
XL,XE,Dragons,BBC's, and others 80's machines.

My e-mail : tsarig@zikim.org.il

Thanks a lot and regards.
Kuki.

Wow! What a deal! I encourage all interested to take Ben up on this offer!

Imagine: Free brand-new Atari monitors, never used...

Atari went out of business several years ago, but Ben still has some unused
ones.

Jump now!

Or was the headline just a tease??

;)

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

Atari 8-Bit Computers: Frequently Asked Questions / Michael Current
mailto:mcurrent@carleton.edu
http://www.faqs.org/faqs/atari-8-bit/faq/

2299. 2600 to 5200 Adapter

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-15 00:00:00 UTC
From: llpwhite@cs.com
Message-ID: <20000415001752.17942.00001638@ng-fs1.news.cs.com>
Source record: 45460

I just saw a 2600 to 5200 adapter from Atari. Never knew that this existed. Since the 5200 is so close to an A8 computer, that means it should be feasible to create an A8 adapter. (WHY is another matter :-) Anyone know what the pin-outs of the 5200 and 2600 cartridges are (or a link where the info might be found)?
Larry

2301. 1050/xf551 settings...

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-15 00:00:00 UTC
From: Tony Cianfaglione <ab616@chebucto.ns.ca>
Message-ID: <Pine.GSO.3.95.iB1.0.1000415014232.20017B-100000@halifax.chebucto.ns.ca>
Source record: 45462

How do you set up a 1050 or xf551 to act as drive 1, 2, 3 or 4. The 1050
has black and white slider and the xf551 has 2 little dip switches.
What positions do they have to be in?

Thanks...

2302. FS: Brand New Atari Jaguar Units, Games and Accessories

To respond to this message, please use the enclosed link rather than your reply button.

Updated as of 04/14/00

I have a limited amount of brand new Atari Jaguar items for sale or trade. These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping.

If you are interested in any of these items, please respond to me by using this automated link jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (all contain one controller, RF Box and AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $50
- Atari Jaguar with CyberMorph cartridge $40
- Atari Jaguar (No Cart) $30

** Atari Jaguar Accessories - New**
==========
- Jaguar unit alone (No power supply, controller or accessories) $20
- Team Tap (4 Player adapter) $30
- Composite Video Cable $15
- Spare Controller $15
- AC Power Supply $15
- RF Switch Box $10

** Atari Jaguar Games - New/Shrink-wrapped**
==========
- Checkered Flag $10
- CyberMorph $5 (No Box)

Atari Force Comics Please make an offer
==========
All are in Mint Condition

- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for rare or shrink-wrapped/sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- A working Phillips or JVC 4000 series Dish Network receiver
- Working DSS H or HU Cards
- And of course the ever popular, original Intellivision keyboard (should I be so lucky :).

The 2600 adapter is a whole Atari 2600 in a small case
with audio and video outputs running into the 5200. The 5200 itself
is just disabled when this adapter is in use.

The 5200 is pretty much an Atari 400 with a different memory
map in the hardware area. Of course the hardware is set up different
as well, joystick ports, sio port, etc. The 5200 also has no real OS,
the bootup screen that gives off to the cartridge.

> it and are around B-ville I could shoot you a copy(or email me your home
> address)

I think we ended up hand-drawing most of the maps, certainly the
tougher ones. We had the damnable game pretty well down to a science
by the time we finished playing it.

>
> You get to see some pretty pictures and a message as I recall??

Sounds about like what the game would have. I did a search for
solutions, and found a couple. It looks like we had the right words,
but entered them in the wrong order. Bummer. I still have our
character disks & the original disks for the game. Maybe I'll get
lucky and catch a springtime flu and stay home. Just think, either
watch the Jenny Jones show or finish U4 after 12 or so years...

Did you play any of the later games in the Ultima series? (As I
recall, you turned me on to Ultima 1 and 2, and I think gave me a
...ahem... copy of Ultima 3)

See you,

Greg

Source record: 45467

Hi all,

I have an Atari 800 that I used back in the 80's as a word processor (as
well as games and graphics) now what I want to do is transfer all those
files to a PC word processor. Is there a way to get the PC to read the
Atari disks? Or a way to connect the two to transfer the data?

Thanks for any help.

Source record: 45468

I just made up a pile of disk images (1-16mb) in Sparta format, zipped each one, converted them to self-extractors and added a "how-to" doc. The whole package is about 470k. Any (non-obscene) suggestions as to where to send it if anyone wants it?

I don't have ftp access here, so it would have to be attached to an email. Also, I don't really want to keep it too long on the victoria.tc hard drive as I only have 6mb of space.

Thanks.

I'm using a 1050 as d1 and 2 - xf551's as 2 and 3 but didn't have the
switches set coprectly so they wouldn't poll properly. I need the 1050 to
format flipsides of disks. Should I use the xf551 as d1 instead?

Hi Tony,

Ok, on the 1050 the setting are as follows:

Black & white to the left: Drive 1
Black right, white left: Drive 2
Black left, white right: Drive 3
Black & what right: Drive 4

On the XF551:

Both dips down: Drive 1
Left up, right down: Drive 2
Left down, Right up: Drive 3
Left and Right up: Drive 4

Hi Curt and Jim,

Here's an intersting problem. Each drive (by itself - set as d1) will
boot fine. None of the drives, however, will work as any other drive
which was what my problem really is. Setting the switches as below,
drives 2 and 3 refuse to poll or work even though d1 works fine.
Switching the drives makes no difference as whatever drive acts as d1
works and the other two don't. Is this a problem within the 130xe
instead?

Tony

Jose.
If your A8 word processor files have a lot of special printing, it may be a bit tougher (underline, bold, italics). You may want to edit the files to remove special printing stuff. After that, most Atari 8(A8) word processors pretty much were just ATASCII files. You can convert ATASCII end of lines to ASCII 13,10 EOLs fairly easily. Or you can print the document to a file to get 13,10s sometimes.
A null modem and term software on PC and A8 can do it. You can even use the phone line, if you have two phone lines, with term software. Then there's sio2pc/APE cable. Cheap and easy to build. That's probably the best way to do it yourself. Info and APE software can be found at www.nacs.net/~classics . Finally, you may just want to let someone who is equipped do it for you. I think Bob Klass will do that.

The power out the SIO port is weak. Try hooking up two drives at a time
instead of three. You might, in that way, find that one of the three is
the cause of your problems. Generally, two drives should be more than
sufficient.

As I understand it, inside the adapter was a complete 2600 system minus
the power supply and RF modulator.

I'll give it a try and let you know. I was originally just going to use
the 2 - xf551's but then learned they won't format the flipside due to the
timing hole so I scouted around until I found a 1050 and was going to use
that to format the disks on the flipside.

SIO2PC. But it won't do you much good if the PC is sitting at your
friend's house (really looooooooong cable required). Buy an old PC for
yourself. Even a $5 8088 will do; the first one I used had 256k RAM and
two 5.25 floppies.

I've done it with APE/sio2pc. I got the files over to Windows 98, then
loaded each file into Word, and did a search and replace (deleted all of
the ATASCII end of lines). Worked slick.

2320. 1050 Write protection

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-16 00:00:00 UTC
From: rhamiiton5@aol.comedy.com
Message-ID: <20000416163033.15590.00000563@ng-fo1.aol.com>
Source record: 45481

My 1050 has one of those 3-way switches for: Write to any disk, Use notch status for writing, and Protect every disk. Recently it will only write with the switch in the "Write to any" setting even when a notch is present and open. Does this mean that either the emitter or the receptor diode in the mechanism has failed? Has anyone replaced one lately? Is it reasonably possible for the novice solderer?

I saw not long ago an inquiry but not any answers on drive mechanisms; what are the controlling properties for a mechanism to replace the 8-bit drive in an 810, 1050, Percom? Will most standard 360k mechanisms function single sided in any of those applications?

-Ron

-Ron

I don't have a solution but I admire the problem.

>now what I want to do is transfer all those files to a PC

Two modems will do with two phone lines; null modem instructions are in the FAQ for this group.

Ataridsk or Anadisk are reported to work for Double density 8-bit disks.
MyUtil is similar and has CR/LF translation.

Happy 7.1 has capability to read/write PC 51/4's and do the CR/LF thing.

I would be happy to make the conversions if no one closer volunteers; can do individual files or ATR/XFD images.

-Ron

I don't have a solution but I admire the problem.

>drives 2 and 3 refuse to poll or work even though d1 works fine.
>Switching the drives makes no difference as whatever drive acts as d1

You do not specify exactly what error occurs; if it is DOS 2 or 2.5 make sure 1802 ($70A) is properly configured for D2 & D3.

You can check strength of SIO signal by connectiong D2 to the XE and chaining from it to D1. You may have to pre-format all the disk back sides on D1 1050 and then reboot and do the writing with the D1 551 (if it is not a european mechanism) and XE ramdisk to avoid some floppy swapping.

-Ron

I don't have a solution but I admire the problem.

I am trying to use a joystick with Atari800Win without success.
I have set-up the joystick and calibrated it using the "Joytick"
properties in the Win control panel. But when I run Atari800Win it says:
"DIERR_NOTFOUND" and closes. If I remove the joystick Atari800Win runs
okay with the "keypad joystick". This is version 2.5c of Atari800Win.
I'd appreciate any suggestions on how to solve this problem.

Possibly; try XLSearch here for ChipMunk & BlackPatch:
http://www.newbreedsoftware.com/xlsearch/
Each of these programs is able to disable the protection for a sizeable list of
mostly game software. Usually they make a sector copy of all readable sectors
and then alter the code to jump around the part which does the protection
stuff. If yours are not listed, then you will need to find someone with a
Happy modified drive or other similar custom hardware.

Is it a standard joystick / pad or some fancy driver related one?

If the stick can be found as standard in the game controllers panel with at
least Direct X 6.0 installed then it should be fine?

Well, that's what I though too! :) It's a standard 2-axis,
2-button joystick. It shows up fine in the joystick control panel. Hmmm,
I wonder if I don't have the latest version of Direct X.

Its been a very long time but I though the XF551 in the US didn't
require a timing hole. The drive spins at 300 RPMs and the onboard
cpu does some funky stuff to get it working at 180(?). I've been
able to use flippies in mine for some time.

Thanks. My user group has the pool disk set (sitting on my book shelf
right now :).

All I need now is a working CDROM.

The Pooldisk Too contains a text only version. No HTML. Ian might be
planning on making a HTML version himself. We sent him the text files
so he could do that if he wants, and if he has the time.
Ian did reserve the exclusive right to put it online, so indeed, it is
not allowed to copy the stuff from the CD or make it available
otherwise, as clearly stated in the text file written by Ian,
which can be found on the CD in the same directory.

Now what is a Pooldisk doing sitting on a shelf huh?

Keep those Pooldisks spinning.
Ernest.

2348. LOBO Disk Drive Unit 8" & 5 1/4

2349. 130XE Power Supply 1 amp or 1.5 amp?

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-18 00:00:00 UTC
From: omar27 <omar27@ix.netcom.com>
Message-ID: <8dj12jvrt1@slb3.atl.mindspring.net>
Source record: 45411

Hi all,
After owning an Atari 400 many years ago as a child, I recently picked up an Atari 130XE in pretty good physical shape at my local thrift shop. It came with no cables or power supply whatsoever. (Also picked up a Commodore 1084S RGB monitor)

I have found the power supply for it at several places, with a great variation in price, and I noticed there are two possible types....
7 pin DIN 5 Watt +5VDC @ 1.0 Amp .....$9.95.....(at www.jameco.com)....OR
7 pin DIN .....+5VDC @ 1.5 Amp.....$27.00..!!!!!(at http://www.best-electronics-ca.com/130xe.htm)

Both are for Atari, but will the 1 amp work as well (or at all) with the 130XE?

Since I picked up the computer for $15 (untested yet) and the monitor for $15 (works but don't know what cable to use), I don't want to spend more than I have to until I know this is a working system. (Don't have any game cartridges yet either).

Any advice or knowledge will be greatly appreciated.

Regards,
Omar Alvarez

You beat me to the punch announcing the latest additions.

We've added eight new issues in the past 3 days -- the full text
of 62 Antic issues are now online.

November 1985 - Vol. 4 No. 7 - New Communications
March 1987 - Vol. 5 No. 11 - Inside Today's Atari Corp.
November 1987 - Vol. 6 No. 7 - The Winners
June 1988 - Vol. 7 No. 2 - Power Up!
July 1989 - Vol. 8 No. 3 - Atari Glyphics
October 1988 - Vol. 7 No. 6 - Atari Grand Slam
August 1989 - Vol. 8 No. 4 - Mapping the Atari Returns
September 1989 - Vol. 8 No. 5 - Joystick Test Lab

In addition, there's a new section, "Where Are They Now?" Find
out what happened to your favorite Antic writers/editors/programmers.

Source record: 45413

The 1 amp might work; the 1.5 will.

A cheaper, more powerful alternative is an old PC power supply. I'm currently powering my 1mb XE off one I ripped out of an Tandy 1000 (8088, no HDD). By running one of the +12v lines through five diodes in series I also get +9vdc for the MIO and XEP80. Another bonus is the on/off switch.

PC supplies will not run without some kind of load. In my case, the load on the 12v line is sufficient to keep the thing from shutting down even when I switch off the Atari. If you have nothing else, an old PC floppy will provide enough load.

If and when the Tandy PS dies, I've got one out of an IBM PS/1 that's even better as it has a nice quiet little fan. These should be available for free nearly everywhere as they're useless (only 70-80 watts) to PC owners.

The only thing I've used in ages from an Atari PS is the cord.

I'll second this. I think I have 3 PC power supplies just laying around for
this type of thing. I am pretty sure I have not paid more then $8 for any of
them, some were probably less.

In comparison, I just spent $12.95 for a LM340 5V 3 amp regulator + $2.40
for a case and a few other odds and ends to make a PC power supply to run a
MP3 player for a car. The 12V regulators for it were ~$1.50 each and even
the cigarette adapter cost ~$5. The thing runs hot as a pistol. Had I chosen
the cheapest route for an Atari power supply, it would have been ~$7 for a
transformer and <?>maybe<?> I could have gotten away with something like a
7805T 1.5 amp @ 5 volt regulator.

Not all of them require a load. Most of the newer ones I have fooled with
don't, but as you noticed the older 8088 stuff may need a load.

Have no direct knowledge of the LOBO, but the only 8" drives I ever saw on the 8-bit connected thru the ATR8000. Other than that and possibly the BlackBox, I have strong doubts.

>exist? If it does, is it available for the PC and would I need an emulator to
>play it.
>

Ahhhh...I remember my friend and I used to play Vanguard at the local 7-11 as kids like it was going out of style. I bet todays arcade manufactures would love to have a few arcade games in every 7-11/Circle K in america like they used to back in the 80's.....ohh well. Anyways, I love Vanguard. It was manufactured by Centuri in the arcades and was brought to the 2600 and 5200 by Atari. Was there ever a prototype for the Atari 8-bits????? I have both the 2600 and 5200 carts and they are both excellent games. Taking the 2600 limitations into account, the graphics are great and the control is dead on, but the graphics are nowhere near arcade perfect. The 5200 has near arcade perfect graphics, but like most 5200 games(with the exception of Star Raiders and a few others), the control sucks because of the 5200 joystick. The contol might be OK on an emulator...hmmm..I might have to check it out myself. My favorite Atari 8-bit emulator is Atari800win, it emulates the 400/800/XL/XE and the 5200. Try to find the box art on-line also, it is really cool and gets you pumped up to play the game and blast away the evil alien horde. :-) Anyway, get yourself an Atari 5200 emulator and find a Vanguard ROM and enjoy.

This is not true. Years ago we had a mouse handler that only used the
VBI. It was published in MegaMagazine. Issue #7 if I recall correctly.

I run my MIO on 9vac.
I too have a pc power supply in a large box that also has a couple of
9vac transformers in it. I fitted several plugs on the front to run
all my equipment.
I even modifyed my 1050 a little to plug directly into the dc outs.

I've heard of MIO's that eat AC but mine wants DC according to the manual that came with it. I do have to admit that my diode trick is pretty crude but it works without taxing my rather limited electronic abilities.

I've thought of running the disk drives off a unified power supply but just haven't bothered as I have more power supplies than drives which seem to die faster.

I remember reading about this upgrade many years ago in Antic and last night final found the review of the upgrade.

My question now is who owns it? Bob Woolley?

Was there every any major problems with the kit? How many of the kits were sold? Is there a way to get a kit or to produce the ROM needed and the instructions?

If anyone has the answers please let me know Im very interested in this project.

Don

The manual says dc but if you look in one, you will see a full diode
bridge and smoothing capacitor. It is then feeds a 5v regulator which
powers the whole mio.
I did try the diode trick on a flash many years ago. had about 8 6amp
diodes in line from a 12 v car battery. trouble is the flash drew so
much current, the diodes got so hot so quick that the solder melted.
6amp ac maybe.

I think I identified it - See below
LOBO Drives has made a large change in the pricing of their powerful LX-80 interface. LOBO is now offering this interface for just $449.00 with a full 32K of ram. This is the interface that runs 8", 5", Single density, Double density and double sided drives. With the LX-80 you can even boot a MOD I Double density system disk. This is an excellent bargain on a proven product. Now I have to find the TRS80 Newsgroup for more info. I have some of the pieces. I have a TRS80 Model 100 coming and I have two Model I's in the basement. Who knows I might get them running. Now all I need to do is find a LOBO 8" drive or a pair.

Hello folks,#
many users e-mailed me, that they are interested in Diamond GOS.
Unfortunately I have only one cart plus accessory tool disks left. For
now, Tony xxx (forgot his family-name, sorry !!) was the first one who
showed his interest. If I get a positive response (the money order !!)
from him Diamond is definitively sold. Otherwise I will let you know,
for now I put you on the hold - ok ?!?
greetings - Andreas Magenheimer

I believe you can buy a complete 3.5" upgrade kit from
Bob, and it works good.

The ROM modification required to run n 80 track DS drive
was posted to this group some time ago. I sucessfully implanted
a dual 3.5"/5.25" TEAC drive mech in an XF551 using it. These
2-in-1 drives are hard to find but definatly worth the effort.

I am looking for Bally Astrocade and Arcadia 2001 games (boxed preferred, but not required). I have lots of stuff for trade (2600, 5200, 7800, 400/800, Colecovision, Intellivision, Odyssey2,etc.) at:

http://www.msu.edu/user/reicher6/

I don't have a trade list, but I am usually willing to trade things out of my collection for something I want. I prefer to trade, but I will entertain paying cash for something really rare.

I may have developed it, but I certainly don't own it. That is, I never made any effort to retain any rights to it. It is PD all the way.
Bob Puff may have some of his version of the upgrade left. Innovative Concepts is no longer around as far as I know.. Lots of folks could burn you a ROM.

The only issues I ever had with it are the spin-up delay and the density switching option. A standard XF551 starts formatting without waiting for the drive to reach full rotational speed. Sometimes this is OK, sometimes not. By forcing spin-up, the drive has to be at speed every time you format a track. This sounds like a good idea but it also slows down writing data a little bit. So, it becomes a toss-up. The other catch is the density switch. If you are in DD and you try to read a SD disk, the drive will get a read error and the drive will retry the read in SD. Not so if you are in SD and you try to read a DD disk - it will try SD f-o-r-e-v-e-r. You can add code to make it alternate density on a read retry until it gets it right. This will at least give you a chance at reading a DD disk after a SD has been read. It does lead to a ping-pong match sometimes (don't even think about using some protected disks...)

2376. Re: 130XE Power Supply 1 amp or 1.5 amp?

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-20 00:00:00 UTC
From: Schoengarth <dons@qnet.com>
Message-ID: <38FFE7B5.21990D7@qnet.com>
Source record: 45438

Either of the power supplies will do fine. Most people recommend the 1.5A. I have used the 1A on a 65xe,130xe and a XEGS. I buy these brand new from a electronics surplus. I have bought 5 of them and never had a problem. I guess your wondering who in the world would still sell such a thing. I really hate to give out my secret surplus because some day I may need a few more and they wont have any left.

http://www.allelectronics.com

They have two stores one in Los Angeles and one in Burbank,CA.

Check them out they will do mail order. The Burbank store if you call them and ask for the Atari power supply will know exactly what you are looking for. They also have some other Atari items that even the store employees dont know what they are.

2377. Atari 400 Audio Digitizer?

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-21 00:00:00 UTC
From: Will Irace <will@irace.net>
Message-ID: <8dqfcc$4fg$1@nnrp1.deja.com>
Source record: 45346

Back in the eighties, I ran across an article *somewhere* that described how to digitize a few seconds of audio into an Atari 400/800 via a simple homemade circuit plugged into a joystick port; audio could be played back over the television speaker (and of course it sounded awful). I actually built the circuit at the time and played with the software, and now I'm feeling nostalgic. I'm trying to find that article again.

I've scoured the Hardware Mod FAQ and the "Compute!" index (http://sniper.npsnet.com/danf/cbm/compute.idx) and actually reviewed physical copies of Compute! magazine for all entries having anything to do with Atari Sound, to no avail. Does anyone have any bright ideas or remember this article? It was definitely a 400 I did this on.

Thanks in advance,

> I sucessfully implanted a dual 3.5"/5.25" TEAC drive mech in an XF551 using it. These 2-in-1 drives are hard to find but definatly worth the effort. <

Hi Steve-
I've thought about this before, but never done it. Most of these units have two connectors, but some supposedly have only one and are switched internally A/B. This would be really easy to hook up with a CSS dual drive upgrade, but how would you do this with Bob Woolley's XF35 upgrade? Also, how does the 5-1/4" read/write -- 80 track, low density? But presume you wouldn't write over a regular 360K disk due to the difference in the track width? Interesting hack Can you furnish some details?
Regards,
Larry

All the way across Atlantic Ocean? If the person sent your stuff via
ground, that will be 6-8 weeks. If he sent it air mail, it shouldn't
have been more than a couple weeks at the most.

I do worry if the emails aren't being answered anymore. And criminal
prosecution across the borders are next to impossible. The most you
could do is post a bad trader warning and hope his future "victims" do
take the time to search deja.com first.

The drives I have have 2 thin drives in one HH package, both are connected
via a card edge connector, which is nice since it matches up with the XF551
perfectly.

> This would be really easy to hook up with a CSS dual drive upgrade, but
> how would you do this with Bob Woolley's XF35 upgrade?

The drive uses jumpers to set which mech is drive 0, so i just used
a SPDT switch. Attach the common pole to ground, and the switch poles to
the ungrounded side of each drive 0 jumper. Flipping the switch then
swaps the drives 0/1 / 1/0.

> Also, how does the
> 5-1/4" read/write -- 80 track, low density?

The drive wont double-step by itself, so unless you add a circuit to
double the steps, it wont read/write regular Atari 5.25" disks, except for
track 0. I believe Bob's upgrade uses a module to do something like this, but
I have not seen the upgrade myself.

Of course having 2 80 track DS/DD drives is worth stacking it on top of
a regular 1050 for old disks. :)

To all,

Thanks for all the information. Looks like I'll have some fun(?) tinkering to make it work. When I finally go into spasms because I can't get it to work then I may have to get one of you who is all set up to transfer the stuff over. Thanks again to all for the inputs.

2387. FS: UK : Atari 800XL and other stuff

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-21 00:00:00 UTC
From: keith@keefy.co.uk
Message-ID: <3901afcc.6396282@news.freeserve.net>
Source record: 45356

Hi...

I have the following stuff for sale... I can split, but would rather
let the whole lot go together. All is in full working order with the
relevant cables, someone make me an offer.

Atari 800XL with manual and power supply.
Atari 1050 5.25 floppy disk drive with power supply.
Alphacom 42 Thermal printer with power supply, manual + spare paper
rolls.
Approx 50 * 5.25 floppy disks with stacks of programs including games,
utilities and other stuff.
Game cartridges: Galaxian, Pole Position, Frogger, Pit Stop, Q-Bert,
Miner 2049er, Centipede, Super-Breakout (All boxed)
Books: Inside Atari Basic by Bill Carris
Atari 600XL Program book by Peter Goode
Atari Basic by Bob Albrecht/Leroy Finkel/Jerald R Brown
Games for the Atari by S Roberts

I also have about 500 Atari ST 3.5in disks.

> I would be very interested in getting hold of an Assembler/Editor
>Cart if anyone has one for sale.
>

Have it if still interested, what I normally prefer is a DOS loadable image for
ASMED & BASIC. You can call DOS and load the other without doing a cold start;
it keeps the RAMDisk and any ML code in RAM ($600 or $4000) but you do lose
some program space.

Dids you ever find the BASIC manual?

-Ron

I don't have a solution but I admire the problem.

Hell, if it was sent "ground" from Brazil to Norway, it aint gonna make
it! Hopefully it was sent "surface" or air. ;-)

2391. More RAM For Free

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-21 00:00:00 UTC
From: "John K. Picken" <yg473@victoria.tc.ca>
Message-ID: <Pine.GSO.3.95.iB1.0.1000421205018.16351C-100000@vtn1>
Source record: 45360

For those using SIO2PC (and probably APE): did you know you can gain 64k of RAM for disk image storage very simply?

Ensure the following lines are in your MS-DOS config.sys file:

```
DOS=HIGH,UMB
DEVICE=C:\DOS\HIMEM.SYS
DEVICE=C:\DOS\EMM386.EXE NOEMS I=C800-EFFF I=A000-AFFF
```

The second area included with Emm386 is the VGA RAM area which is only used for graphics programs which SIO2PC is not. This gives you an extra 64k of RAM for "DOS" programs.

2392. Accessing A Full 64k

Newsgroup: comp.sys.atari.8bit

Source record: 45361

Can any of the hardware geniuses out there come up with a fairly simple way to access the 2k of RAM hidden by the hardware addresses. If the area could be remapped and swapped in as needed, I can think of all sorts of neat uses for it.

Hmmm. I am considering putting a guy on my BAD TRADER list. He's in Brazil and I am in Norway. I've sent all the stuff to him, I must confess I did screw up. I sent him all the Lynx stuff, forgot to put in the Jaguar game. Two of the boxes for the Lynx games were empty. I did not know this. But, I do understand him wondering about this. Anyway, I took the two Lynx games missing, form my collection, and sent them to him. I ordered the two games myself and got one of them, the others on the way. I put those two carts and the Jag game and sent them. He confirmed getting it and said my package was on the way. Still haven't got it, this was March, 20, 2000. I emailed him several times after this, but he just won't reply. Can I report him anywhere ?

He used the name :
Jaci Silva

The games were sent to :
Ivone L. Durigan
R. DR Teodoro Langaard 825
CEP: 13070-060
Campinas SP Brazil

email address : atarian@zipmail.com.br

Any suggestions as to my next step would be ? Thanks in advance

hmmm. that would require another mmu, and another bit on Port B.
however 256 bytes that Antic uses cannot be touched. Antic selects it
self. the other chips are selected by the mmu and a LS138.

There was an article in Antic written by Steven Lashower<sp>.

He reads this group from time to time, but if you may be able to find the project on one of the various sites that store old Antic.

As I recall, he just used the Atari joystick 5V supply with the audio being applied to the base of the transistor through a capcitor to block DC and a pot/resistor adjusting the sesistivity. The output of the transistor/buffer circuit was then feed to the POT input of the JS.

Just double checked because I knew they were in bankruptcy, but they are back online at www.syquest.com with most of their drives technical info in Adobe Acrobat format.

They list a EZ230, but I didn't see a 200 meg drive. I do have a Hard Drive Bible around here somewhere, if they don't have the info you need or no one else comes up with it, let me know and I will see if I can find it in my HDB.

Kind of glad they are still around, I own both an EZ135 internal IDE and EZ135 external scsi. I thought they were a better hardware then Zip Drives, 2x the data rate + 20% more storage + same price, but I guess the market place decided I was wrong.

Alway could just add a CMOS 8 bit by ~1k though for fooling around the empty
hardware areas.

I think you could just about use $D600-$D7FF without bumping into 90% of the
hardware mods.

For people w/o BB, MIOs, or bank switched carts, you could add $D100-$D1FF
and $D500-$D5FF. The taps for these decoded addresses are all on the
74LS138.

You could also remap the 74LS138 such that it only uses the 1st 16<?> bytes
on the hardware pages. Trying to remember what the most registers any of the
hardware has. Anyway, at one time I modified an 8 bit by removing the
74LS138 and piggybacking a second one to it. Something like 2 of the chip
select pins are hardwired to ground or 5V, so all it took was running
jumpers from the address lines to the CS logic to decode the existing
hardware to the bottom half of the page. The 2nd 74LS138 would have allowed
for 8 additional chips i.e. pokey, PIA, or memory to be added to the top
half of the hardware area. Almost enough to have a ram dos if the
$D600-$D7FF is used too.

I tried the set up with several types of software, and it all seemed to work
normally.

2406. 14C89 Cable Transistor Add-on Circuit

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-22 00:00:00 UTC
From: llpwhite@cs.com
Message-ID: <20000422174412.15421.00003062@ng-cl1.news.cs.com>
Source record: 45371

I just built and installed the 2N 3904 transistor
add-on circuit for the command line, and I can't
get it to respond at all. I wondered if anyone else has
built the circuit?

The cable worked before I added the circuit, and it worked
after I cut the new circuit back out, but I could get absolutely
nothing with it in place. *Double checked everything*, but I do
have a question about the diagram. I downloaded a data sheet
on the 2N 3904 transistor, and I followed that pinout. It says
that (from top to bottom in the schematic) the pins are

Collector
Base
Emitter

There are lots of differences in transistor pinouts, so I was wondering
if the schematic shows the opposite order (which I think is generally
a more common pinout):

Emitter
Base
Collector

It's possible I have a bad transistor, but I thought I would check
and see if anyone else had any experience with this before I rebuilt the
circuit.

Thanks,
Larry White

Paging RAM in at $D600 should not interfere with the MIO or BB as that area can be selectively enabled/disabled with those beasts. What would be more useful would be some kind of scheme to enable the whole 2k at some other address, much like the self-test ROM.

If someone can come up with a simple and cheap way to accomplish either method, right off the bat I can picture using it to decrease Memlo with MYDOS. If it has to be paged, the simplest hack would be to use it for DOS buffers. If it can be banked as a whole 2k, either a good portion of DOS or a small resident DUP or even a command line interpreter could be stashed in it.

A few people thought it was not too nice to have full name and addresses in my good trader page. I didn't think that was a big deal, but I removed the street addresses. I wouldn't have minded it myself, as it a positive page.

The good and bad trader pages are located at : http://home.sol.no/~olavese/

Is it still too much information on the good trader page ? Please let me know.

Look real close at the flat side, there _should_ be, if it's a TO92 case,
little letters, E B C. If you are holding the flat face at you with the
legs down, E should be on the left, B in the middle, and C on the right.

Yeah, I looked at their site first, and they didnt have the specs for this
drive either. Its older than the EZ130 and 230 series.. Is the SQ5200
(Syquest 200mb).

I looked in my old HD bibles and couldnt find it there either..

Any help appreciated.

Just found mine, sorry but the latest one I have a listing for is 89 megs.
This is edition 8 that runs to 1996 and includes other drives out to 5 gigs
so I guess they just never listed that drive. Last model I have listed is
5110.

You would pretty much have to re-program the PAL to do what you want easily.... With a new PAL you could use the BASIC line, for example, to select memory in the Basic socket instead of $5000-$57FF. Heck, why be stingy? Take a whole 16K down there! Or, Bank in 512K!

Anyway, it is not so easy to enable the system DRAM in another location, which may be what you are looking for. A ROM or SRAM is easy, but not another piece of your regular 64K space. I wrote an article a long time ago called (I don't even remember - told you it was a long time ago) that enabled $D600-$D7FF as RAM. I added two more DOS buffers using the space - would be handy for these DD DOS2.0 setups I have now.

If you are really hot for this and don't want to re-program the PAL, you will have to break into -CI and -I/O and all that stuff. Not a fun project.

Bob

It was called the Antic Sampling Processor (published in Antic, of course).
Very simple, but worked pretty well. There was also the parrot, a
professional product that was similar.

Does anyone have a good ref for a schematic that uses readily available parts? I am currently using a LM 340 5V 3 amp device and it gets really hot even when only delivering ~1 amp. I am sure the puppy would deliver the 3 amps, but it really gets so hot it scares me. I also paid too much for it, $12.95 as an NTE product.

Perfect for my app would be no more then 3-4 parts but most importantly RUN COOL!

Suggestions for how to get the device to run cooler such as droping the 14V DC going into to ~7V could be done too if that would work. I am not really familiar with the device as I have not worked with one since the 70s.

I've seen several National Semi references, but they all reference using their own LM195 transistor to get drive current up vs something simple like a 3055 or TIP.

I'm also aware of the 78xxT devices that deliver 1.5 amp and am very pleased with their performance, just want a full 3 amps.

Geezzzz... $13?

The LM350 is adjustable from 1.2 to 30+ volts and delivers 3 amps. Costs $3
in the current Jameco catalog. All you need is two resistors and a couple of
bypass capacitors. The schematic is in the spec sheet at national.com.
As far as the heat goes... anything you use that does not switch the levels
from zero to Vcc will produce a bunch of heat. You have to get the heat out
to the ambient or it will cook the parts. No magic there. Use a fan or lots
of holes in the case. A huge heat sink in a sealed case will melt down just
as sure as a small one.

2417. XF35 Code

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-23 00:00:00 UTC
From: Atari Bob <ataribob@mindspring.com>
Message-ID: <8e0b8u$o0g$1@slb7.atl.mindspring.net>
Source record: 45382

I saw some references to the XF35 kit so I thought I'd post the code changes in the ROM. These are the latest versions as far as I know - like I'm not too organized...

Here are the changes made to a standard XF551 ROM (NOT an XF35 ROM):

ADDR TO

1. $0528 $00 spin-up on FORMAT only.
2. $0680 $50 make 80 tracks.
3. $080F $60 2's compl of max sector.
4. $0811 $FA hi byte of #3.
5. $053D $03 seek to 3ms+spin-up.
6. $057B $1B seek to 3ms.
7. $09D1 $0B seek to 3ms.
8. $0B15 $1B seek to 3ms.
9. $061D $F4 write with precomp.
10. $0621 $F4 write with precomp.
11. $0D0D $A0 write with precomp.

To alter the retry restore (where the drive is trying to re-read a track that gave him an error), add a JMP $E0 (24,E0) at $09AF. AT $9E0 and $9F0, add the patch:

a. $9E0 $09 INPUT A P1
$53,08 AND #08
$C6,F0 JZ $F0 jump if zero
$9A,CF AND P2 #CF
$8A,10 OR P2 #10
$99,E7 AND P1 #E7
$24,B1 JMP $B1
b. $9F0 $8A,30 OR P2 #30
$89,08 OR P1 #08
$99,EF AND P1 #EF
$24,B1 JMP $B1

This will force the alternate density every time you do a retry restore and thus switch you to DD when you need it. It works on 5 1/4 and 3 1/2 and is independent of the other changes.

Enjoy!

Bob

2418. Wanted: Simax Video Signmaker & Arcade Game Design disk

I'm looking for these Atari 8-bit programs:

- Simax Video Signmaker (in fact, any Simax programs if there were others)
- and the disk of source code/games that came with the book Atari Graphics and Arcade Game Design by Jeffrey Stanton.

If you have access to either (originals or copies) please e-mail me.

thanks
Kevin Savetz

They do get hot- the best thing for it is a nice chunky heatsink. I've used the 7805 and 7812, they get pretty hot as well. The transistor follower approach apparently works (I've never tried it), though by doing that you're only moving the dissipation from the regulator to the transistor. You can't get a cool power supply unless you move to a switcher. A linear regulator is acting as a variable resistor in series with your load, the resistance is dynamically adjusted to deliver enough current to maintain the particular voltage across your load. You could view it as a voltage divider.

Say you want +5dc out at 3 amps and your supply is 10volts. Since the output is 5 volts and the load is consuming 3 amps, Ohms law says its series resistance is 1.6 ohms- thus it dissipates 15 watts, and keeps your room nice and warm...

The regulator is getting 10 volts in, it wants to deliver 5 volts out, so it adjusts its resistance so the total current thru the regulator and load is 3 amps. The normal voltage divider equations apply, and the regulator's resistance is then 1.6 ohms- so it has to dissipate 15 watts as well- which is just a bit below what a Pentium 1 dissipates. The regulator has a smaller radiating surface than a Pentium; so a heatsink is essential, the bigger the better. A nice chunk of 1/4" aluminum is what you need, or smash flat a length of 3/4" copper pipe. With this much power getting dumped as heat, thermal grease would be helpful too.

At a 1 amp load, the regulator is only dissipating 5 watts, but without a heatsink thats way too much considering its radiating area- look at how big the wirewound 5 and 10 watt resistors are. It doesn't really matter how you arrange the regulator in a box, just as long as you get the heat out. You could build the power supply into a metal box with the regulator attached to it inside (given adequate attention to electrical insulation...).

As your load diminishes, its resistance is going up, so the regulator also increases its resistance because the required current is decreasing- and it dissipates less also. This is why the little to92 5 volt regulators don't blow up like firecrackers- they're only rated for 100ma or so.

Power supply stuff is black magic once you get beyond the basics. I've always just tracked down DC supplies at hamfests. Once I lucked out at a fleamarket and snagged 3 linear supplies that give +5 @ 15 amps, -5 @ 1 amp,

+ and - 12 at about 1amp and +24 at 250ma for $5 each.

Regards,

Gregm

One option: get a video card that accepts composite in. Then patch the
Atari through the PC. You can do the same with sound.

Result? One monitor, one speaker set. Screen captures off the Atari become
easier, plus you can run Ape98 in one window and the actual Atari in
another.

Just my .02

OK, so I'll switch to the LM350 Bob suggested and try to drop the voltage of the supply. It will be running off a car battery, so I can expect 11-14 V. Since there is a 1.2 V drop for the regulator, I could probably try to find something like a 5V @ 3 amp zener to drop the voltage to the 6-9 range to cut the heat a bit.

Apparently the MP3 car player hack is doing really well. My son is the one pushing for it, one of the guys I graduated from highschool with is now a programmer for IBM and from what I understand just finished writting a fairly complete program for driving the 2x20 LCD screen as and output device. Supposed to be able to pretty much control the IBM with directory output to the LCD screen and ability to select songs etcetera.

I am not sure what the final 'hot' hardware configuration will be. IMO: Since there is a approximately a 10 to 1 compression from normal audio CDs to MP3, it may be the best system will be a really small HD and a CD ROM. Originally we were just talking about a just HD since you could could put the equivalent of 100 CDs on a 6 gig drive, but I think a CD ROM makes a lot of sense too. Tough call, I don't even own 20 CDs, I don't have a CD ROM burner, but we would like to get a formula that a lot of people can use.

I think thats the right approach, getting the voltage drop down across the regulator will let it run lots more efficiently. How are you handling the > 30 volt spikes coming off the car's mains when the alternator fields do their thing? I did a little car computer some time ago, I just used a 20 volt zener to ground on after the project's fuse. I imagine putting a 1 or 2 ohm resistor in series with the supply would also be a good idea to put an upper limit of how much current your regulators have to soak up.

Thats a cool idea. Those lcd screens have fairly capable text cursors, so a nice api layer would be extremely useful. I've always wondered if you could create a Unix tty definition for one of those displays... but I'm not a termcap wizard.

I've been toying with ideas on and off here too. I bought a little point of sale terminal some time ago, which would fit in a shoebox- 486/33, ram, 1 slot for soundboard,etc.. but its too slow to decode mp3's. I was going to throw an ls120 into it for removable storage, but it wouldn't fit inside the case. What a drag... but at least it runs Linux pretty well.

I think I'll take the laptop w/ inverter approach with the sound output playing into the radio's cd inputs. Not quite as elegant as a built-in mp3, but at least I can fiddle with programming while wife drives...

Greg

Hi, I have to following Atari 8-bit stuff that I am looking to trade for some other 8-bit (400/800) games or a 400/800 Series modem- acoustic modem especially.

Computers: 400 & 800 Computer

Cartridges: Pac-Man, Submarine Commander, ET Phone Home, Soccer, Computer Chess, Pool 400, Galaxian, Defender, Basic, & Microsoft Basic II

> Hi,
> did you tell me the pinout of monitor for Atari 800XL ?
>

Looking into the monitor port:

Clock Position
The notch 12:00
Pin 1 (Composite Luminance) 2:00
Pin 4 (Composite Video) 4:00
Pin 2 (Ground) 6:00
Pin 5 (Composite Chroma) 8:00
Pin 3 (Audio Output) 10:00

If I recall correctly, the 800XL did not have one of the connections internally (Chroma I think) but I have run 800XL Composite Video and Audio directly to both a monitor and a VCR without problems. If connecting to a monochrome monitor, you get better results running Luminance to the monitor's video in.

Radio Shack sells (used to sell?) a 5-pin DIN to 4 RCA plug connector that works perfectly. The RCA plugs are color-coded with 1=Red, 3=Black, 4=White, and 5=Yellow. I'm currently using a Commodore monitor cable and the color-coding is the same.

I was thinking there would be a problem with the controllers, but I guess
the next question to ask is, where the controllers plugged into the adaptor or
the the game unit?

OK, I will add this too in the 2nd one I build. For now I think I will just
tell my son to only run it with the car not running to eliminate this
possibility.

He actually went to a local car show we have in the area to check things
out. There is a group of custom/vintage car buffs that get together in at a
parking lot in Campbell Calif at least once a month I think. He wants to
demo the thing there first to see if there is any general interest or if
everyone just wants to stick with their standard $2,000 Blaupunk, Sony,
etcetera set ups.

I asked him to do a small interpreter for it so it can be general purpose.

To wind this all the way around to Atari, if it had a small interpreter that
you could have comands like:
EXECUTE "C:ATR.TXT"
and have a text file something like
****
PRINT "Hit JS Button 1 to load BIG.ATR"
PRINT "Hit JS Button 2 to load GAMES.ATR"
A=INPUT JS()
IF A=1 THEN RUN "SIO2PC BIG.ATR"
IF A=2 THEN RUN "SIO2PC GAMES.ATR"
****
Maybe it is only me, but I kind of like the idea of clones doing things w/o
150 watts of monitor attached. SIO2PC type server with small LCD panel would
be a classic.

I think my son bought about 7 of the 2x20 panels, I have to put a few more
together this week.

Too slow for even the DOS version DAMP? I know they recommend pentium, but I
think they actually had someone with a 486/120 that got it to work. Would be

interesting to see just how low you could go.

At any rate, my son says he wants to use my web space for putting up some MP3 blurbs. I think he wants to try selling kits but don't know exactly what he means by kits.

If you do the series resistor thing, be sure to give it hefty wattage- a 1/4
or 1/2 watt gives a nice, incandescent glow and lots of magic smoke.

Good luck to him! Its a great idea.

Sure would. It sort of reminds me of a tube site I ran into some time back
had the coolest motto; "Yesterday's technology solving tomorrow's problems
today".

> I think my son bought about 7 of the 2x20 panels, I have to put a few more

I never tried it in DOS, just Linux. It is a 486/33 SX, and isn't easily overclockable. The real drag of it is its loaded with several digital IO ports, originally intended to drive the cash register, receipt printer, etc- and would be PERFECT for twiddling a little LCD display.

I've a AMD 586/120 that plays mp3's OK under Linux, if you're not doing much else that is...

Well, I figure, if I can get her to want to play MP3'ed books on tape in the car, I could advocate getting a laptop because its "ever so much more useful, dear."

There's actually an Atari 1064 memory upgrade that simply plugs into the
600XL's PBI slot (and offers a pass-through), if you can find someone willing
to part with theirs.

Besides the 64k upgrades, there are a very small number of "Yorkie" upgrades around. They are PBI plug in for 600xl or 800xl, and give you 256k RAM. I beleive they do ANTIC banking and are 130xe compatible.

I've never seen one, just read about them i nAtari Classics.

Good luck looking for one!

> Are they backlit?
No two alike<sigh>, but all of them are 2x20 and some of them do have
backlights. It isn't that hard wiring each one individually, they all either
have the 14 pins in a line or double row, or 16 pin double row. About 1/2
seem to have backlights.

I am trusting that all 14 pins will has the same function on a pin no matter
what line up, and the 16 pin ones will do the same. He has someone to take
over assembly if he actually finds 7 people that want these. Hopefully he
will settle on one supplier as I am not to sure about how qualified the
person he is going to have do the soldering is at winging it.

Even have one 4X40 he picked up sitting here, but I don't have a driver for
more then 2 lines right now.

Seems there's precious little information on the 'net about this classic SSI game, "Galactic Adventures." All that I've been able to come up with is that the author was Tom Reamy with Strategic Simulation, Inc. (SSI), it was released in 1983 and was an expansion on its predecessor, "Galactic Gladiators." This is pretty much the sum and total of what a simultaneous search of 19 search engines produced. I havn't been able to find any screenshots however, even in scans of SSI's 1985 catalog, but I'm still pretty sure this is the game I've been looking for. Anyone ever come across an image of this suitable in an emulator? I'd love to still have my real 8-bit to play it on, but unfortunately this Windoze box is the only means I have to relive my Atari glory days. :-)

> VBI. It was published in MegaMagazine. Issue #7 if I recall correctly.

Ivo,

This is impossible. The ST mouse is a dumb device, and therefore has to be
polled - at the very LEAST - once for every pixel of movement. If the
handler
runs only in VBI, it will only work if you move your mouse very, very slowly
(up to 50 or 60 pixels a second). If you'd move the mouse any faster, the
movements would not be read properly.

The article you are referring to, by The Missing Link, clearly mentions that
it uses a Pokey timer interrupt and not a VBI.

I just added one of these to my ST system and for what it's worth, here is the information my ICD hd software reports back to me:

SQ5200C
SCSI Embedded
Heads 2
Cylinders 2260

BTW, this drive is also capable of reading and writing to Syquest 44 and 88 Meg cartridges, but can't format them. I use it on my Mega ST4 as my boot drive, and it works great! Boots just fine from either 200 Meg or 44 Meg carts.

It's good to read you describe it as a "gem," too. It gives me confidence that it will last a while!

Thanks,
Hugh

2443. Will Generic RF modulator work with 130XE?

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-24 00:00:00 UTC
From: omar27 <omar27@ix.netcom.com>
Message-ID: <8e0i08$n8d$1@slb7.atl.mindspring.net>
Source record: 45386

Hi Folks,
Let me first of all thank everyone for the info provided above concerning my rookie question regarding what kind of power supply (1amp or 1.5 amp) to use with my Atari 130XE.

I ended up ordering the more affordable ($10) 1 amp version and it seems to power up just fine (I think).

Now, I need to obtain an RF modulator from somewhere... I am also going to order a monitor cable from someone who posted a message on this group, but in the meantime, I would like to test this baby out on my Sony Trinitron TV set. I have Audio/Vido RCA jacks, as well as the F-Connector on the rear of the TV set.

I also have an old beaten up Commodore 1084S monitor with a whole host of connections on the back (looks complicated). No cables provided with this one.

Will the $4 "Generic" RF modulator sold at Radio Shack work with the 130XE??
If not, please let me know what other modulators might be compatible.

Regards,
Omar Alvarez

You shouldn't need to get an RF modulator from anywhere as there's already
one in the XE. Output is a single RCA jack between the two DIN's with a
channel select switch right beside it. Just make a cable that goes RCA-F
Connector. You can also run direct into your TV's audio and video: pin 4
of the monitor DIN jack is composite video and pin 3 is audio out.

Thanks for the info. I'll try that on my 130xe.

Regarding the GEM comment - it's true. I've been using Syquest drives since the old 8mb days. These things are rock solid, bullet proof and take a lot of abuse.

I've not had a single Syquest crap out on my in almost 20 years in computing.

The only failures have been in the carts.. hence I've stocked up like World War III! [grin]

Has anybody ever connected their 8bit to an SVGA monitor?

A while back, I bought a device from TigerDirect (dont recall this TV Tuner device's name), but it never really worked.

I got a greenish grainy picture, and after two weeks, decided to part with it on Ebay.

Have a really nice dual source (has a switch built into it), SVGA high resolution, flat screen - on my desk, and would like to clear up all these monitors I'm using.

Thanks

I've only had one break, I was putting together a system on a work bench and had the drive on the counter top. I tripped over the extension cord and the drive fell ~3' to the ground, head hit the platter and it broke off.

But when I asked at where I bought it about waranty they looked up my record of purchases to see I had bought the drive there and replaced it w/o me even being ready with a reciept. I still have the replacement drive and it works perfectly.
>
> The only failures have been in the carts.. hence I've stocked up like
> World War III! [grin]
Their web site FAQ says they that even though they were bought out, something like 12 mil lock, stock, and barrel, the plan is to continue supplying carts.

I still wonder how they could lose. I think they were the drive of choice for DTP and Macs. They must of waited to long to lower their prices to Zip drive levels or something.

Long ago I had a 1200xl that I parted with too soon. Now I have gotten a 600xl in a vain attempt to rekindle my mispent youth (yah!). I was wonder how expandable it is. Is 64k all I can get (I'd be happy with 64, but I keep seeing post about 130s with 1meg...

Also I noted that the 64k upgrade is a solder in type. I have no problem with soldering, but any helpful hints would be greatly appreciated.

Source record: 45318

Hi John,
Thanks for your help

> Pin 1 (Composite Luminance) 2:00
> Pin 4 (Composite Video) 4:00
> Pin 2 (Ground) 6:00
> Pin 5 (Composite Chroma) 8:00
> Pin 3 (Audio Output) 10:00
What is the different before Pin1(Composite Luminance) and Pin4(Composite Video)?
In HardwareBook, I found the pinout map of "scart" jack, and in this scheme there is only "Composite Video In / Luminance" in a only pin. How I can make a cable 800XL / VCR if I can't know this difference?

Please, excuse me for my bad english.

Regards

Salvo

Tony:

Part of your problem may be that the settings in the message below are incorrect for the XF551. Drives 1 and 4 are OK, but 2 and 3 have been swapped. The correct settings were sent to you by John Picken.

The XF551 manual states:
D D = 1
D U = 2
U D = 3
U U = 4

The Instant TV was made by AIM Labs -- the same people who made the JAM!!
These devices work better with S-Video. But you might try this link:
http://www.mat-co.com
You will probably have to email them -- they still list the VGA 801 video
processor, but it is not pictured on their pages. This unit has been reported
to work well (but I do not have one).

I too was puzzled about their leaving the business. I have Iomega and
Syquest drives, and the Syquests were faster and more robust. The carts
were interchanghable too (EZ235 could read EZ135, Syquest 200 could read
44, 88, 100, etc..

At any rate, you mention they were bought.. By whom? I thought they went
bankrupt and liquidated.

I've only hooked up a couple, but the pin assignments were pretty consistent
(as long as you started from pin 1, wherever that was).

> Even have one 4X40 he picked up sitting here, but I don't have a driver
for
> more then 2 lines right now.

I scrounged one, non backlit, some time ago. I've been really lax with my
home projects recently- my current one uses a 240x128 graphic display- at
the moment my drawing routines are having trouble with shifting pixels
around.

>I was wondering, I recently purchased a 1030 modem...can I actually use it for
> something, BBS or gopher or what?

Hey, if you don't have a interface it is better than nothing, and some
BBS's still do accept 300 baud connections. Also, if you had an Atari user
nearby you could trade over the phone (remember those days). ;)

I used a 1030 modem extensively from 1984-1986 or so when I got an 1200
baud modem.

You know what is strange, I remember trying 2400 baud modems with Express
(BTW, I have a program for the 1030 called Express1030 which is pretty good),
and the data was choppy and didn't run very smooth. (That was 1987 or so)

These days I'm running an Atari 800 at 9600 with Bobterm and Ice-T and it
prints the text just fine. (1999-2000)

In both cases I used an 850 interface.

Have we just gotton better at writing more efficient programs? I know I'm
amazed by how well it is doing.

(more about syquest).
Funny. I bought a Syquest Sparq 1, they went out of business.
I bought a Hayes accura 56k. They went out of business.
I bought lots of Atari stuff, they went out of business.
I can understand Atari. But Syquest and Hayes were really
substantial companies. Now you get an Orb drive and US Robotics
modems. I think the Orb was/is designed by the same guy who
designed the Sparq. If anyone is interested, don't get the Sparq,
it isn't a good drive.

I've never really liked the way any mouse works. It would make more sense to
me if they just had counter circuits like a couple of 74LS191 or whatever is
the best fit and use those to either translate position directly or transmit
serially like a MS Mouse or Nintindo JS.

I guess US Robotics (now 3Com) cornered the Modem market about the time that Hayes went under. Hayes had bought up a few companies, including Practical Peripherals, which, in turn, had picked up Maxxom, etc. Sort of reminds me of the thing about little fish and big ones ...

In any event, I, too, became interested in the Sparq drive for a while, but I noticed that an alt. newsgroup soon formed and the complaints about the drive were mounting. At the time, I had a 2-gig hard drive in my PC that was rapidly getting filled up. Iomega, which soon bought most of Syquest anyway, was getting good reviews on the 1-gig Jaz and I bought one, together with an Adaptec SCSI card (the Syquest card was temporarily unavailable.) I'm sorry I didn't spring for a 2-gig model. The one-gig has always been reliable, but in terms of the multitude of .ATRs, .mid and .kar files I've been collecting, it's not really adequate.

Now that we're completely off-topic (for which I apologize) I must tell you that I'm seriously thinking of a new PC at this point. It will probably materialize around July or August, by which point there will be no new 2-gig Jaz drives available the way things are going.

Sad, isn't it?

IIRC MegaMegazine is available on the Internet somewhere. All of the issues.
I have placed the text and the files here a couple of time. Unfortunately, the
disk where these files are on is damaged. So I can not send them to anybody at
the moment.

BTW the mod is a simple one. You just stick a resistor (not sure what value)
into the connector that connects the mouse cable to PCB inside the mouse an off
you go.

: matrix cart.

The 1027 printer uses an "Ink roller"....the best way to re-ink them is to use an ink pad.....roll the roller into it, and print....as long as the roller doesn't disintigrate, this should work.....replacement rollers are hard to find, and probably dry of ink anyhow....

Or, take my advice and toss the whole thing into the garbage and get a dot matrix printer for your 8 bit....someone will give you one, if you ask....

Hi Rob,

You can get them from B&C Atari Sales: www.myatari.com or from Best Electronics: www.best-electronics-ca.com or you may want to consider moving up to something a little bit faster. If you like the real letter quality, consider an Atari XDM121 daisy wheel printer, its a little chattery but faster then the 1027, if letter quality isn't a necesity, but you still want to stick with an Atari consider the XMM801 dot matrix or if you have an interface for parallel printers like an Atari 850 interface or ICD PR: connection and so forth, maybe you should consider a low cost used laser printer.

>If it is "The Impossible" isn't that the one that requires a cartridge to
>make a backup of copy protected disks? I seem to recall it was like "The
>Pill"<?> in that it used RAM to store the copy protection.

Nope, the Impossible was a hardware upgrade that will unprotect floppy software
. The Impossible keeps track of what the software is doing (checking for some
protection scheme) and then put two things on a new disk. One is a copy of the
software you wanna copy, the other is a file that will fool the software into
thinking it is ready the original disk. BTW I don't own an Impossible. I just
kept ready the CSS ads.

From: "David A. Paterson" <david_p@storm.ca>
Message-ID: <8eb1jgnun1@news.storm.ca>
Source record: 45208

Rick:

The Yorkie upgrade did run on the 600xl. It had 256k onboard; once installed, it deselected the RAM inside the 600xl (that's my understanding, at least).

It would be nice to track down the design of this upgrade, and see if plans could be freely distributed. I'm sure there are many people interested in such a beast - since it also works just fine on the 800xl.

David P.

Max ram on 600XL-

unfortunately it uses a rather different memory method than the other computers. It uses two 16K by 4 bit drams. The upgrades wire in 2 64K by 4 bit drams. To get more requires severe butchering of the motherboard, and building a daughter board. So much trouble, no one has designed one yet. The 800XL and 130XE are much easier to expand.

1027 ink roller...

I have found that some types of rollers for calculators will work o.k. in it. But they need to be cut to length-use plastic gloves.

If looking for alternatives-there are plenty of ink jet printers that work with an interface. Even notebook printers such as the Kodak diconix.

Is there anywhere I can find some good info on u pgrading an atari...

upgrading the:
Memory (320 or 512k should do)
CPU (to a 65c186 @ 14 Mhz)
Display chip (80 columns)
CMOS like OS (OS memory is RAM with battery back up)
...and alternate operating systems to use this setup...

I've heard of all these upgrades, yet I can find little detailed info on the
net..mostly just stuff like:
This upgrade kit was produced by <insert company here>

>whether any modifications are required or any other relevant information.

Atari used Chinon and Mitsumi IIRC.
If you can't find these, make sure you have drives that only need low power
(low Amps). But I guess most modern drives are.

You might have to extend the flatcable that is inside the XF551 though.
(either by replacing it, or by crimping on a piece of flatcable. I you use
these crimp on connectors you can still use a "standard Atari" mech.)

> no email and I hate calling and bugging people about something so old.

I've heard that Innovative Concept started to be a bit unreliable (the company,
not the stuff they sold) when the 8 bit market started to collaps.

I have one of those Dual Drive 3.5" conversion kits by CSS (with my version,
you could even use two 3.5" mechs instead of one each). It works great. And
Bob Puff is still available. He even updated BBXFER (a utility for the
BlackBox that will let you copy files between Atari 8 bit and PC and ST disks)
last januari. Unfortunately there is a bug in the Atari to PC copy code.
Which is also new. I went back to BBXFER 1.7

From: atarircx@my-deja.com
Message-ID: <8ecdqu$5g7$1@nnrp1.deja.com>
Source record: 45227

I have 3 working 5200s, and picked up another spare from the junk store last night. Its a 4-port version, and I have both 2 and 4-port versions already. What is really bizzare about this 5200 is that there is *NO POWER JACK*. There is not even a hole in the case for one. On all my other 5200s there's a power jack within a hole in the 5200 case on the back, lower-right side next to the channel select switch. This newly added 5200 has just the channel select switch. I've studied the case for quite a while and see no possibility of getting power to darn thing. I guess I could take it apart... but does anyone know what's going on here?

No 65xxx derivation has ever run faster then the standard 1.79 mHz Atari
clock speed. None are currently available except used.

But for some good hardware hacks one of the best starting places is:
http://www.redshift.com/~cdyson/atari.html
> Display chip (80 columns)

Hopefully you well get a better answer since this is mostly a guess from
seeing a 5200 board w/o a case, but it could be brought in on the RF out
jack. The power supply caps and voltage regulators are mounted right next to
the jack which is kind of a tip off.

I think he always had a real job in the aero space industry, making F-14s or
something.

His brother John is still around, the one who did the ST port of AR City and
688 Attack Sub. I can't remember the name of the company he heads now, but
when Lord British and and ~20 other people at Origin got fired he posted
that his company was hiring.

2521. Assembler/Editor Cartridge???

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-28 00:00:00 UTC
From: Mark Steele <steelem@uswest.net>
Message-ID: <steelem-94E7C8.22232628042000@news.uswest.net>
Source record: 45238

I've got an Atari 800 and the Assembler/Editor cartridge. I've
attempted several times to create a cartridge image to use with
an emulator, but I've had no success. Recently, I dug out my
old Analog magazines and came across Tom Hudson's Boot Camp
articles which re-sparked an interest in attempting to under-
stand assembly again (the reason I picked up the Assembler
cartridge in the first place about a dozen years ago).
I am now back to my original problem of getting the cartridge
as an image file so I can run it with an emulator.
Does anybody know where I can download an image such as this?

Thanks in advance,
-Mark

You misunderstood, no Atari upgrade, which is what you wanted and I even
mentioned Atari in the reply, has ever run faster then 1.79 mHz.

2523. Perplexing emulator problem

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-28 00:00:00 UTC
From: Mike Kohary <mkohary@earthlink.net>
Message-ID: <390A6857.E712E080@earthlink.net>
Source record: 45240

This one has me completely stumped (and I'd say I'm something of an emu expert). My PC has two hard drives, c: and d:, and a CD-ROM drive, e:. I am using Atari800Win, which is installed on the d: drive. All Atari disk images are in .atr format.

If I try to load a disk image from either of my hard drives, I get an "Access denied" Windows error. Yet, if I try to load an image from a CD-ROM, it works fine. This is true even of identical images (i.e. images copied from the CD to my hard drive). It is also true whether Atari800Win is installed on the c: or the d: drive.

Get this: there are exactly five images that will load from the hard drive, and they are all dos images (dos_20s, _25, _30, _40, _XE). But only those 5, which I have located in the same directory as Atari800Win. If I try one of my other images, from any directory including the same directory, no dice. But those 5 dos images work. That drives me nuts - why those and nothing else?

Atari800Win used to work for me just fine, but I haven't used it in a while, and I don't know what I changed on my system to break it (I change my system often). It used to work back when I had only one hard drive, but for obvious reasons, I'm reluctant to do this kind of troubleshooting.

Any ideas from anyone? Is there some emulator setting I'm missing? Does the dos conundrum provide any clues? I'll bet if I could figure out why those work but nothing else, I'd have the answer.

Thanks in advance,

Mike

Several solutions available in addition to the image I am sure you can find
somewhere.

There are several other assemblers available, most run faster then the Atari
ED/ASM. MAE is one, and there is the disk based version of MAC 65. These are
available from archive.umich.edu and a bunch of other places.

I also have used TASM from Speech Technologies, not the Borland TASM for the
IBM. TASM is a table driven assembler for MS DOS that has the definitions of
for a 6502, quite nice really. You get to edit in 80 columns and I would
guess even on an old 286 it compiles 10x the speed of an Atari.

If worse comes to worse, do you have a disk drive and DOS for the Atari?

All you have to do is go to DOS and do a binary save, something like
D:EDASM.COM, $A000, $BFFF, $A000

and that will save the cart as a DOS loadable file.

>such a beast - since it also works just fine on the 800xl.

Reading this prompted me to dig out a magazine called Atari Monitor, i believe it was the Atari magazine of maplin Electronics, anyway, this one has details for a 256K upgrade for the 800XL.

I also put an additional 256K in my 130XE at one time, giving 320K, using some PD designs.

If you have an APE or SIO2PC cable it's not too hard to use the Atari to get
an image and copy it to the PC
There are a couple of pins on the cartridge that (if I remember correctly)
activated the cart. and give it control on boot.
If you (the way I did it - quick and dirty) tape over these connectors and
extend a wire form each conector and booted the atari, it wouldn't 'know'
that there was a cart. Then connecting the wires would cause the cart memory
to be activated. Then use a copy util on dos....done. A COM file of a cart!
Sorry for the lack of detail....there is a dos program out there that does
this..

2532. Supercart roms and 8-bit emulators?

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-29 00:00:00 UTC
From: Charles Hoffmann <chuckhoffmann@mindspring.com>
Message-ID: <ovalgsg8u3a0092to8dlroeqcm23ghcfda@4ax.com>
Source record: 45249

I own Basic XL and Action! for the old Atari 8-bit computers. I've recently read about two Atari 8-bit emulators that would allow me to use OSS supercart roms with them, but I don't know how I would dump the contents of the supercart roms to use them with these emulators.

Could anyone point me in the right direction as far as information on how to dump the roms from my carts or where I could download copy of these roms someone else has dumped?

"A trigger is just another kind of delete key."

2533. Use of Joystick in Emulators?

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-29 00:00:00 UTC
From: cskaryd@my-deja.com
Message-ID: <8eera7non1@nnrp1.deja.com>
Source record: 45250

I'm a bit of a newbie to the Atari emulator world. I scanned through a few of the FAQs that I've seen listed, but I did not find anything that mentioned a Atari Emulator for the Windows platform which allows you to use a PC joystick in the Atari emulator. Is this possible? Which emulator(s) can do this?

I'm so happy to find this Atari world. I still have my old 800 and about 9 zillion old (probably gone bad) floppies. However, I've been unable to get one of my favorite games, Floyd of the Jungle, to work on the emulator, Atari800Win. It will get to the Enter # of Players screen and will not allow me to enter anything. Has anyone gotten this to work?

Please reply via email is possible.

Thanks...

OLD PUTERS: (Experienced computer users and programmers only please. I don't enjoy giving tech support so If you have any trouble using todays computers these might be a little too much to handle :) These are relics. They behave and should be treated as such.

1.TI994a (Texas instruments) color ($25)
Comes with all adapters required as well as "Beginners Basic" and "Users reference guide" books. Also comes with one cart, "Parsec".

2.TRS80 (Tandy) Color computer 2 ($40)
Sorry there are no reference manuals for this one but the setup is pretty basic. I do however have the manuals for the software and games and i'll throw in a copy of "family Computing" <circa 82>. The best thing about this computer is that i actually *have* the 4 cart multi-pak interface for it! (I'm such a nerd :)
Comes with these carts:
Dungeons of Daggorath (Too cool, first video RPG Ever!)
Handyman
EDTASM+ (Color computer editor assembler with ZBUG)
Clowns and Baloons
Downland
Personal Finance II (Requires 16k RAM <Bwahahahah>)
Also included is the speech sound cartridge
I've also got a bunch of 5 1/2 floppy games for it but you'll have to get the drive seperate (I'm using it for something else).

3. Atari 830 Acoustic modem ($10)
-comes with (what's left of) the box.

Hi,

The 4 Port Atari 5200's introduced a unique and innovative connection system. To cut down on all the clutter from various cables running to and from the TV, the Atari 5200 utilized a special automatic switch box/power system. This brought power to the Atari 5200 through its COAX cable and also allowed you to not have to reach behind your TV to slide the switch on the switch box to set the TV to use your videogame. Despite the Atari 5200's drawbacks with its controllers, the unit introduced some very innovative features in 1982.
You'll need the special switchbox, it came in two versions, one with both COAX and prong wire antenna connections and the other with just coax RF connections. You can find them on Ebay from time to time, or you can buy them new from any of the Atari dealers listed:

B&C Atari Sales: www.myatari.com
Video 61 Atari Sales: www.atarisales.com

Hi Don,

You have a dealer right up in your neck of the woods called Far North Computers, run by Frank Stallings, I don't have any contact info, but do a local Yellow Pages search or search the internet, I'm sure he'll turn up. He used to be an Atari dealer. I've bought a lot from him and he has a good stock of products and fair prices.

If he wants to risk it, he could hack into the system. IIRC: Only two 7805's
in there to adjust the voltage. He would have to solder/patch a into the
input pins and ground, supply at least 6.5V DC to them, and probably add a
DC blocking cap to the RF out to be on the safe side. 30 minute job max if
he has the parts.

OK, but I have never seen it forsale or even heard of one that actually got
sold or seen one on the used market.

Until I actually see one forsale or someone says they bought one, I consider
it vaporware.

Sheesh! I made a ~2.1 mHz Atari myself, but I never offered it forsale ergo
I say there has never been a faster then 1.79 mHz Atari.

This whole thread is about things you can buy or build, not prototypes and
hacks that you can't get plans or parts for.

(Rick Cortese says do a binary save from DOS to dump the ASMED cart.)
Right, that'll dump it. But the problem remains that when he tries to load it, the screen memory and display list will crash the load, as the dump tries to load over them.
You have to have a small routine to move the display list and screen memory down under A000 before you load the cart dump.
It would be easier to just get a already fixed ASMED from a site.
I checked spudster and couldn't find it.

Body handling: HTML body converted to readable text

Know someone with an EPROM burner? That would be the easiest solution. Just
break the cart appart and read the ROM.

It gets a lot harder if you can't do that.

Mark.
Right. An image to use in an emulator.
I couldn't find ASMED anywhere on the internet, so I decided to
do it myself on my site.
Here's the really dumb thing. Both IE 5 and Netscape 4.7 mess up
in downloading my arc files. IE 5 adds a ..AR to the end of the filename,
but gets the files right. NS 4.7 adds bytes to the files! Screws them up.
I put up a binary load of the asmed. I always use ARC or ZIP because
unarchiving will do a crc check to make sure the file wasn't corrupted.
I suppose I'll change the files to zip files, but in the meantime if you
or anyone want to see the stuff, it is
www.en.com/users/russg/proglang.htm

Russg
(I guess you want a ROM image, just the image of the ROM,
your binary dump from DOS won't give you that, it will add a
FF,FF,00,A0,FF,BF six bytes to the beginning of the dump.)

I downloaded the PS 800xl schematics, but my printer will not print it to one sheet. I was wondering if anyone knows how to scale it down or break it into two separate pages that can be glued.

Just as a by the by comment, I was checking out how the hardware area is switched in. It looks like it would be trivial to add a logic chip between the MMU and the 74LS138 to decode the hardware into the lowest 32 bytes of each page. I couldn't get the schematics printed for what happens with the existing RAM to deselect it in the hardware memory area.

>
>
>I do not know how to set up the Atari 800 emulator. I have had problems
>placing the roms and the connectivity to it.
>
>Kenn
>>
>>Get Atari800 (or Atari800Win). This one runs both AR: The City and
>>Dungeon almost flawlessly.
>

Here's how I set up Atari800Win 2.5c:

First, click on Atari->Cartrige and tell it where to find the basic
ROM file (usually called ATARIBAS.ROM) You can also select whether or
not to hold down OPTION to boot without basic here.
Next, go to Atari->Hardware and select the machine you want to
emulate. Make sure you point each one to where to find its ROM files.
Mine's set up like so:

800 OS-A - atariosa.rom
800 OS-B - atariosb.rom
800XL - atarixl.rom
130XE - atarixl.rom
320XE - atarixl.rom (both Compy and Rambo)
5200 - atari5200.rom

Next, set up any mounted virtual hard drives -- these are directories
in which there are straight binary executables for the 8-bit Atari.
These are accessed under DOS 2.5 (or your favourite DOS) with the Hx:
device, where x is the virtual drive number (eg. H1: for first, H2:
for second, etc.) This isn't absolutely necessary, as you can also
load EXE/COM files from the Atari->Load EXE/COM menu item.

Finally, select the XFD/ATR file the Atari will boot up with through
the Atari->Disk Drives menu.

You can also tweak the emulation settings under the Options menu.
Mine's set up like so:

Options->Display - 336x240 In a Window
(I often change this to 512x384 fullscreen; both options
allow for full overscan)

Options->Sound - 44.100KHz playback rate, pokey advisor update 2
Options->Joystick - Use anything with this; both my Sidewinder and
V3 racing wheel (with the joypad)
work here.

All other options are default in my setup.

You can get Atari800Win at most good emu sites. My personal faves are
www.vingategaming.com and www.classicgaming.com.

Yes!! I've done this 'upgrade' and it works great. All you have to
keep in mind is that you are looking for a 360K drive and not the 1.4
meg drive. Just pop it in and plug it in and go. Mine worked better
than ever.

I have used a few different PC controllers with Atari800Win, with Interact's 3D Program Pad being my favorite since I can assign Start, Option, Select, etc. to various buttons. There are several other gamepads and joysticks that can do this.

> However, I've been unable

I played this game waaaay back in the day and loved it. Playing it with four people leaping around the screen is hilarious. Anyways, get the rom from Holmes's site (great site, Dude!!) and set up Atari800Win's h/w config to be OS-B and make sure basic is loaded; it works like a champ. Oh, and check out the author's name - Sid Meir, of all people! He is something of a legend in computer games, and is still making a lot of popular PC games today.

I posted this in the forum instead of your e-mail in case anyone else had these same questions. This is the first message I have posted in Usenet, even though I have had the capability for over 2.5 years. I just HAD to make the first one be in the Atari forum I have read for all this time. I hope to get to know all the regulars, and some newbies as well.

Trivial really as the OS will do 90% of the work for you. Stuff $A0
into RAMTOP and then close and open channel 0. All the display list
and screen stuff is handled by the OS.

(John says it is fairly trivial to move screen memory and display list.)
Right, but for a novice assembly programmer, such as myself, it
is still a bit of a challenge. The following is my ASM code, commented.
I always close, open, close, even in BASIC. Failure to close before
and after using a channel can do nasty things to open disk files.
Here's my code:

```
10 CIOV=$E456 ;OS vector for iocb function
20 IOCB=$350 ;channel 1
30 RAMTOP=$6A ;where is top of user RAM
32 *=$600 ;this program will start at $600
40 LDA #$0C; close command
50 STA IOCB+2
52 LDX #$10
60 JSR CIOV ;close channel 1
70 LDA #$80 ;moving the dl and screen memory below $8000, could be #$A0.
80 STA RAMTOP
0110 LDA #03 ;open command
0120 STA IOCB+2
0130 L1
0140 LDA EDITOR ;put addr of E: here
0150 LDA L1+1
0160 STA IOCB+4 ;adr of device to open LO byte
0170 LDA L1+2
0180 STA IOCB+5 ;adr of device to open HI byte
0190 LDA #$08 ;aux byte for open to write
0200 STA IOCB+$0A
0210 LDX #$10 ;channel 1
0220 JSR CIOV ;open E: for write, this moves the dl and screen memory
0230 LDA #$0C ;now close 1
0240 STA IOCB+2
0250 LDX #$10
0260 JSR CIOV ;close it
0262 LDA #$80 ;I don't know why I did this twice, must have worked
0264 STA $6A ;better
0270 RTS ;go back to loading an appended file, or just quit
0280 EDITOR
0290 .BYTE "E:",9B$
0310 *=$2E0 ;run it at $600
0320 .BYTE 0,6
0330 .END
```

Source record: 45279

>Charles Hoffmann chuckhoffmann@mindspring.com asks:

>Could anyone point me in the right direction as far as information on
>how to dump the roms from my cart

Those carts are bank selected and a lot of tech stuff on them is here:
http://www.asw.cz/~kubecj/atari.htm

Apparently reading or writing $D50x (x=0 to F) selects the currently available
bank. I was able to read out the BASIC XE cart as follows:
1. Assemble a .COM file to set the bank, copy ROM to RAM, and dump the RAM to
disk file with CIO. Was fairly short ML code and easily fit in page 6.
Attempting to copy the ROM directly with many DOS versions corrupts the file
number and forward pointer bytes in the file.
2. Boot to the cart
3. Go to DOS
4. Load and execute the .COM file

-Ron

I don't have a solution but I admire the problem.

Go to http://www.nationalamiga.com

They have pinouts for almost everything Amiga (which the 1084s was).
There is a button on the main page that says "Technical Data" or
something like that. It will lead you to a page that lists all the
different Amiga things like monitor pinouts.

Some of the 1084 variations also have RCA video/audio inputs that could
also be used.

Whew! That is a lot of code. It can really be simplier then that. BTW:
Thanks for correcting my post.

You can *always* assume channel 0 is open for E:/S: since the OS does this
as part of the boot process. If you are loading the file from DOS, damn good
chance you have channel 0 open if you can see your screen.
Then it just becomes something like
Close Channel #0; E:/S: is already there
Move ramtop at least 800 bytes below cart to be safe. Bug in early versions
of OS scrn clear routines IIRC. If it works w/o the extra 800 bytes, you
don't need to do it.
Open channel #0;E:/S; is still there

2567. Re: Advice on Post Script schematic needed

Newsgroup: comp.sys.atari.8bit
Date: 2000-04-30 00:00:00 UTC
From: Richard Cortese <ricortes@netmagic.net>
Message-ID: <sgpk9pr0oog172@corp.supernews.com>
Source record: 45284

Ignore this. I d/l Ghost Script and it turns out the original PS file was
for larger then standard paper, but I did get to look at the schematic a bit
after resizing the screen to something like 25" X 50".

The schematic combined traces such that I had trouble following paths, but
it does look like if someone wanted to pick lines off between the MMU and
hardware region, plus add a few address lines, the unused hardware region
could be remaped with existing DRAM.

I'm not sure that is the way to do it, seems like a better idea to add a 2k
CMOS RAM, just saying that it looks posible to do with at worst a single PLD
and a bunch of wire wrap.

Haven't checked the MIME settings at your site, but unknown file
extensions typically default to text/plain. In that case, web
browsers and other download programs are required to treat it as
text, which typically screws it up. MSIE has a bug that causes it
to ignore MIME types and frequently gets different results from
other browsers.

The fix is to get the file type for that extension set to an
appropriate binary type.

> I put up a binary load of the asmed. I always use ARC or ZIP because

Adding http:// at the beginning of the URI in posts allows news
readers to treat it as a link.

Message-ID: <390db57c$0$25406@news.voyager.net>
Source record: 45146

(Greg says my site and/or the browser needs an appropriate MIME type
to get .ARC files right. Something like that.)
I changed the files to .ZIP files. IE 5 and NS 4.7 work ok now to
download. With IE 5 you just click on it, with NS 4.7 you hold shift
key and left click.
http://www.en.com/users/russg/proglang.htm
I figured NS was treating the .ARC files as text and adding cr/lf or
something.
The IE thing was weird, it would save the file correctly, but give the
name ASMEDCOM.ARC asmedcom.arc..AR.

The full version is the same as the limited version except where the author has noted. The full version doesn't run any faster or have less bugs so you get the idea how the it will run by trying the limited version. On the down side, even the full version is not finished. It runs most of the software but just not good enough for playing a lot of the 5200 games.(unlike some of the other emulators like for Colecovision which do run great.) I bought the full version a couple of years ago but there was only one update for it quite a while ago. It seems the author as abandon it. I personly wouldn't recommend it. Wacke is better but still not quite there. Hopefully somebody will write a fully functional emulator for the 8-bit/5200 ataris soon.

Hey all! I know this has probably been asked a bazillion times, but I like to know how to connect my Atari 800 to my PC so that I can put all of my downloaded programs (for an emulator) on a real disk. I don't have much experience on making cables or adapters, but I do have an 850 interface and I read somewhere that I can use that. I'd like to know how. I don't have much for my Atari 800 anymore, cause most of my disks are useless since they were used often and they are pretty old. I'd also like to point out that I'm a newbie to most of tthe atart computer stuff. I had only used the computer for games (I was about 4 or 5 years old when my family got one.) Any help is greatly appreciated.
Thanx!

If you have a cable for it, you should just have to buy a null modem
connector to plug into the end of your 850 to modem cable.

There are some pretty simple programs, like miniterm, that are only ~10
lines of basic if you don't have terminal software for the Atari side.

Think about using an sio2pc cable if you want something that works much
better. They aren't that hard to make.

2576. UnZip for the Atari 8-bit

Well, you gotta dump the Rambo....
Latch the data bits in a register that feeds the high order bits of a 512K SRAM using 02 as CLK.
Ground EXTSEL on the PBI (this kills the DRAM).
Run 02 thru two inverters NANDed with 02 and EXTENB for -CS on the SRAM.
Connect the D0-D7 and A0-A15 bits to the SRAM.
Connect LR/W to -WRT on the SRAM.

yer up and runnin' ---> 512K of linear SRAM

looks like 2 ICs and the SRAM -- about $15 + board&connectors and stuff. Plugs into the PBI -- unplug and you're normal again. Gee, you could add a battery and retain the data, even....

oh, you need +5volts unless you're on a 600XL, which has it on the PBI itself.

I guess that's the wrong article and driver then, though I'm 100% sure
both Freddy (aka Frankenstein) and I had a VBI driven mousedriver with the
cursor being part of the characterset (needs 4 characters) so it could be
moved over normal text in graphicsmode 0. I'll see, when I'm at my parents-
place again, if I can find the disk...

2588. Update to ICE Internet PPP test program

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-01 00:00:00 UTC
From: Ken Siders <see_message_text@columbus.rr.com>
Message-ID: <155P4.4108$%G6.60555@typhoon.columbus.rr.com>
Source record: 45291

For those interested and that have tested the program:

I have made an update to by ICE (Internet Connection for atari 8-Bits) test programs. The program can now
respond to a ping in addition to being able to establish a PPP connection. After two weeks of fixing some
obscure bugs in the routines (looking back and code and trying to figure out why the heck I wrote that) the
IP part at least now is working again. Don't try to ping it with too big a data size. There seems to be
a problem handling packets greater than 256 bytes possibly -- so back to debugging. Hopefully things will
progress faster now getting the TCP portion back up to speed so it can be of some use.

> CU Mathy van Nisselroy
>
>
Hi All! (Ok, I'm a newbie here...)

It's great to see all of this continued interest in the 8-bits.
I must've bought just about every CSS product produced. I started with
"The Protector", which was just a sector copier with a switch I had to
hard-wire into my Indus GT drive to create bad sectors (G5's) (worked
with 1050's too). It didn't work with the many products which were
coming out with G4's, G6's, and track-skewing, so I bought the Impossible
(800 version - the BEST!), which was a fantastic product which backed up
JUST ABOUT everything I came across. They even came up with the "XL-
Mate", which allowed others (with XL's or XE's) to use most (ok - some)
of the copies I made on my 800 with the Impossible. I deviated from CSS
for awhile and built two Happy drives, which made completely identical
copies - errors and all - of everything I came across - until things like
"fuzzy sectors" and new wierd track timings came out. Then CSS created
the ultimate copier: the "Super Archiver" which was later improved by
using the "Bit-Writer". Nuthin' could touch this combination. Then, of
course, everybody stopped writing for the 8-bits. Wonder why?

Well, I still have all of my stuff, and it all works. Though both
of my kids have their own PC's they still ask me to play Joust (Pill),
Jumpman, we even had an actual 8-player Breakout game going here last
year - kids crossing paddle-wires - it was a mess, but great fun! My
favorite is still Alternate Reality, The City. The Dungeon was great,
but just didn't have the "atmosphere" of The City (ok, so it was
underground, big deal). The City's music was better HANDS DOWN, I loved
the sunrise/sunset and rain/thunderstorm effects. Ok, enough rambling.

Bye everybody!

Larry

2590. 5200 emulator

Does anyone have the full version of Rainbow for the Mac? I would like to try the full version before I pay the exchange rate on the 15 British pounds asked by the author. I know this does not sound like much, but it comes to almost 40 dollars Canadian. Since this is over half a days pay for me I would like to make sure its worth it before I send any money. The demo I find is very impressive and I think the author put allot of work into it. I in no way intend to rip him off for his product, I just want to be careful.

Any help would be appreciated! Thanks! Wayne......

Both XL-it! and Atari800(win) are very nearly there. Atari800 (DOS)
is currently an open sourced project and it's always being updated...
and it runs Alternate Reality (one of the thorns in other emulators'
sides) just about flawlessly. It also features pretty good 5200
emulation, too. (I don't think XL-It! handles 5200)

XL-it! and Atari800 are only for the PC though. There are no versions of these emulators for the Macintosh.

Wow! That's cool. I really have to hook up my 800XL again. It's all in
boxes after the last time I moved (about 1.5 years ago). As a matter of
fact, I'm only reading this group again for the last 2 weeks. I have
RSI and am not able to use a computer for longer than 5 mins. Right now
I use FreeSpeech '98 but it has quite a lot of flaws. Anyway, it helps
me to read news again after two years! I wonder if I can get my Atari
800XL to respond to my voice via a windoze box and a serial link...

When files are copied from cd-rom they may retain the read-only
attribute, depending on what utility you use to copy them. If A800Win
only sets read-only file access if it sees a cd-rom device, you might
get that effect with read-only files on a hard disk.

Try 'ATTRIB -R *.ATR' from DOS to remove the read-only
attribute of all the atr files.

Steve, you are the man...well, almost. ;) You are correct; when I
copied the files over, they retained the read-only attribute. Thanks
for the sharp eye. I removed that attribute from a test file (that I
know works from off the CD), and it DID change the outcome. Only
problem is, it presented something new: "A sharing violation occured
with file...." Hm, I have no idea what that means - do you?

At least I can guess it has something to do with the file's attributes.
This error occurs when it has no attributes set. I will try different
attributes and combinations by trial and error, but if anyone knows
anything about THIS problem, I'd appreciate further advice.

I do see that the five mysterious dos images (which are the only images
that work from hard drive) have the archive attribute set. However, no
luck when I set that attribute on my test file.

Thanks for getting me started,

Mike

Steve, you *are* the man! This is odd, but it worked: when I removed
the read-only attribute from just a test file or two, I got that
"sharing violation" error. But, when I removed the read-only attribute
from every file in the directory, it worked!

Awesome - thanks for the great advice!

Hmm, do it have a monitor port?
there is a different chip speed between ntsc and pal chips as well as the
video output. so it may be more involved than yo care to plan for. However
if it has a monitor port you could plug it into a Compisite video monitor
which are not tv ?(un)standard reliant.

Hi Ivo. It's good to see you back on here again! I think it is
possible to get the A8 to respond the way you are suggesting. I
haven't tried this, but issuing "-R:" from the Sparta DOS command
prompt should start input redirection across the A8's serial port. The
port should first be set up the way you want before doing this. That
is, use a terminal program or XIO's to set translation, bits, baud,
etc., then closing it with your program or by exiting the terminal
program. Then issue the redirection command "-R:" from the command
prompt. I believe this opens the port in block mode, so you won't see
any characters on the A8 until an end of line is issued. This could be
changed by patching Sparta to use AUX1 mode 13 instead of AUX1 mode 4.
Many years ago someone at ICD told me this, and also mentioned you
could redirect A8 output across the serial port by issuing a "PRINT R:".

Or, a small handler could be made that patches the R: and E: devices
that would accomplish the same thing, like MOE in the Carina BBS
program.

Anyways, it's good to see you back.

My advice is that you get it working in NTSC first, then worry about converting it to PAL. To get a 1200XL to run in PAL you need PAL ANTIC and GTIA chips, then you have to replace the onboard 3.58MHz crystal oscillator circuit with something to generate 4.43MHz and 3.547MHz. PAL Ataris use a rather strange dual frequency setup and the best idea I've had so far for generating these is to take a 17.7MHz crystal from a C64 (4x PAL colour frequency) and divide it by 4 and 5 respectively, though I haven't ever worked out a neat and simple circuit for doing this.

I have seen one that stacked 4 64k by 1 bit drams. looked strange but
it worked.

>To get more requires severe
> butchering of the motherboard, and building a daughter board. So

Wrong. Someone designed one many years ago (15?).
It is a plugin board and has 256k on it. works like an 800xl.
Is a bit of a pain to make however. I have several of the blank boards
here.
Just a matter of remembering what chips went where and how to assemble
them.

Did it have an external power supply?? It it doesn't, it will never
work on an 800xl.
only the 600xl has power on the parallel bus.

> wrong with it is the video....can it be switched?

It is not easy. There is NO provision on the motherboard for the PAL
colour circuit.
Both Antic and Gtia must be replaced with Pal versions, the main clock
crystal is another that needs to be replaced. The Pal colour circuit
needs to be added, a track (?) may be needed to be cut. and finally,
an inductor in the tv circuit needs to be swaped for a different
value.
Do what i do and buy a tv that can handle NTSC instead.
My 1200xl looks good on my 68cm CTV.

I've decided to take advantage of the fact that Victoria Freenet allows users their own web page. I won't attempt to call this anything as grandiose as a "web page", but I've made a start with two available files: my extensive text on RAM, ROM and cartridge control and the large disk images for SIO2PC with SpartaDOS.

Don't (ever) expect to see graphics or anything fancy. My www access is via the Lynx browser through Freenet and I happen to prefer it. In fact when I get on with Netscape or IE, the first thing I do is turn off the graphics and all the other bells and whistles--seeing text only has the advantages of speed and filtering out a lot of the ads :)

Enough rambling, the URL is:

<a href="http://victoria.tc.ca/~yg473/jkp.htm"> (hopefully I did this right for those using a browser).

In plain text:

http://victoria.tc.ca/~yg473/jkp.htm

He died March 1999. He'd come down with some kind of cancer several
years ago, and his brother had flown in from Australia to provide
a bone marrow transplant which seemed at the time to have helped
him recover. Matt leaves a wife and several children in the St. Louis area.

That's all I know.

Amen brother!!

One of the cute things about CAB for the ST was the fact that they replaced
the banner adds with a large question mark. That was cool.
So is the Lynx browser through a local telnet connection, a computer you
have set up?

Dump the RAMBO? Is there no way to run $0000-FFFF on the existing DRAM (including the 16K banks on the RAMBO) and have an additional 512K hanging off the PBI (something along the lines of only grounding EXTSEL if one of the D0-D7 bits is true)? Or would this get too involved and too dependant on nasty timing loops?

Lynx operates on the Freenet (victoria.tc.ca) under UNIX though I do have a MS-DOS version as well as an update called Bobcat. The way it works here is that users can log on via telnet or a regular modem/terminal program and then go to personal files area, email, usenet, etc. To go anywhere on the web, I simply hit "g" and type in the URL. It works equally well with ftp, gopher, etc.

I was using a friend's IBM with Windoze 98 yesterday trying to find information to fix his girlfriend's computer. After a few minutes of putting up with all the advertising, scrolling banners, etc. and not being able to find what I wanted, I telnetted to my account on Freenet and went looking using Lynx--got all my info almost immediately.

Wanted in the UK:

Atari 130XE with XF551, preferably with Demos, or an 800XL with 1050
again with demos.

Also Rescue on Fractalus on cartridge or disk (with a disk-drive
machine).

Finally, I found in my cupboard an Atari 400 with a conventional
keyboard. Is this merely a later 400, or an aftermarket change? It's
been upgraded at some point in its life, as it has a sticker on the base
saying 16K, then one saying it's upgraded to 48K.

Richard - if it's not an Atari, it's just not the 80s...

I've started work on ZIP, which supports deflate. I've gotten it to
the point of where it assembles without any errors. Now for debugging,
sigh.

The A8 code is smaller than the C64 code for the reasons you mention.
The C64 program was ORGed at $801, but I had to *= $2000 to make it
compatable with most types of DOS. (Thanks to John Picken for the
MEMLO info!).

Actually, Win95/98 makes setting file attributes real easy.
Select the files, go to File:Properties (or press ALT-Enter)
and do it...

2630. Re: UnZip for the Atari 8-bit

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-03 00:00:00 UTC
From: Tom Hunt <tom_hunt361@my-deja.com>
Message-ID: <8eoslsfnh1@nnrp1.deja.com>
Source record: 45187

The first thing I had to do was to convert the source files from one assembler format (DASM) to MAC/65 (actually, ATASM). Then I had to change all zero page equates, buffers, etc., over to memory areas that are compatable with the A8. Then I had to change all C64 hardware references over to the A8. Finally, after it would assemble and run on the A8 without blowing it up I had to debug. The C64 has much more memory available than the A8 because it doesn't have a DOS taking up lower memory. But on the down-side, you have to do alot more coding on the C64 to do I/O, because of this.

I know that Richard Gore used to sell it, he had some made up a few
years back (early to mid 90's I think). He used to frequent this
group, but I don't have a current address for him. He used to be good
friends with Dean Garraghty (http://www.dgs.clara.net/), so you might
be able to contact Richard through him.

I don't know if Richard owns the rights to the Yorkie though as it was
originaly developed by a guy at York University. I remember going to
an open day there in the early 90's and being impressed to see an
Atari Trackball on display =)

To all Atarians out there,

Just a open invitation to those out there that can make this meeting or
for some chance will find yourself in the Dallas area this weekend. :)

If you do, you will be here on a weekend where first off, they have the
first Saturday sidewalk sale (which is said to be the largest computer sidewalk
sale like it in the country). Later you can attend an Atari meeting at 5 pm
that night (Saturday May 6th) and enjoy seeing other Atari computer set up or
park your own there, and enjoy some Bar-B-Que at Austin's Bar-B-Que.

We have Rick D who will show off his 800 XL in a case modeified to look
like an Atari Fuji, as well as other activities.

Hope to see you there! If you have any further questions, just ask.

Doctor Clu

More memory eh? This of course is with the "standard" 48k-64K Ataris
right?

So since you didn't need as many I/O routines written into the actual
program itself, the Atari version was probably smaller than the C-64 version.
Is this a correct guess?

So any other files in that group of source files you plan to convert next?

atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
find it hard to keep up with NewsGroups.

e-mail: atari@benjamin.net

To take advantage of Discounts or FREE Monitors or FREE Jaguar Video
Cable, you must E-Mail me to Claim it & state what you want in E-Mail.

Discounts! Buy now! 5% Discount with a $50 Purchase. 10% Discount with
a $100 Purchase. 15% Discount with a $150 Purchase. And a 20% Discount
with a $200 Purchase. Discounts Apply to Classic Atari 8 Bit, Atari ST
and/or Atari Jaguar. Hardware, Software, Books & Accessories! Shipping
not figured into Discount. Customer pays Shipping. Limited Time offer!
Substitutions considered.

FREE Monitor with Atari Purchase! Buy either an Atari 1040STF, Mega 2
ST or a 1040STe and receive a FREE Monitor. Your Choice of a Color or
MonoChrome Monitor. FREE Monitor when purchasing an Atari 8 Bit
Computer. Buy an Atari 800XL or an Atari 130XE and an Atari 8 Bit Disk
Drive such as an Atari 1050 Drive & receive your choice of any Monitor
in the Atari 8 Bit Hardware Catalog. And FREE when purchasing $50 of
Atari Jaguar items, receive absolutely FREE, a +NEW in BAG Jaguar
Composite Video/Stereo Audio Cable. Offer Available for Limited Time
only. First Come, First Serve! Subject due to availability! Customer
pays all Shipping! Substitutions considered.

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out
into Atari Jaguar Hardware & Games. So checkout what's new on my Web
Site. In Fact, check it regularly as my Catalogs are updated regularly.
Customer's are served, first come, first serve! No competing in
auctions. Just Sales, Support & Service! I have 8 different Catalogs, &
my SoftWare Catalogs are my largest. They have the biggest Byte Count.
You should see my inventory! I have TruckLoads of HardWare, Boxes and
Boxes of Software & Libraries of Books & Reference Material for the
Classic Atari 8 Bit, Atari ST & Atari Jaguar Game Machine! And
remember, if you can't come see me today, come see me tomorrow!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump

to my FTP site linked to my WebSite so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor & view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

2643. Montezuma's Revenge, what's the point?

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-04 00:00:00 UTC
From: thor@math.tu-berlin.de
Message-ID: <thor.957430134@math.tu-berlin.de>
Source record: 45108

Hi folks,

yesterday, I played again some of the old 8 bit classics and tried again the "Montezuma's Revenge" title. The long version that includes a title with a tiny animation at the beginning, not the 16K version.

Does anyone know the point of the game? I managed it up to a room where I met "Montezuma", stomping with his foot. Two doors beside his head, one at the left side and one at the right side, a grey and a blue one. I opened both doors but --- nothing. Is there any specific point about this game, or is this supposed to be the "I win" situation?
(That's very different to the 16K version where I can, indeed, collect some scrore at the end of a level)

I also found that some rooms in the right-hand side of the pyramid (yes, it is truely a pyramid if you draw a map) are somehow broken. I get "rolling skulls" in the upper part of the screen near the "score", and a room with a ladder leading upwards I fall down as soon as I try to climb it. Is this supposed to happen, or did I miss some special trick?

So long,
Thomas

It doesn't.
It just checks for the timing hole to see if you're trying to format the backside of a disk. If you have disks that are formated double sided (DOS reads both sides as one disk.) you really love that feature.

For reading and writing to the back side, it doesn't check the index hole. If you formatted the disk as one big disk (two sides, one (main) directory), it will only be able to read from or write to it if the disk is placed in the drive with the same side up as you formatted it.

>Don't know about the technical specs, but it does work on an 800XL.

Yes it does. Soldering in the missing +5VDC lines wouldn't be that hard.
But I believe the 1064 would only overlay it's upper 48kB onto the 800XL's
memory. AFAIK there is no software switch to switch the 1064 out/off.

Help me out please!

I am desperately trying to complete my Atari 800 collection and am
looking for the following:

835 Direct Connect Modem
830 Acoustic Coupler Modem
850 Interface Module
Atari 800 Memory Modules
Atari 800 Game Disks
Atari 800 Advertisements

I have the following I could trade:

Atari 400/800 Game Carts:
Galaxian
Basic
Computer Chess
Defender
E.T. Phone Home
Soccer
Submarine Commander
Pac-Man
Text Generator
River Rescue
River Raid- In box with instructions
Disks:
Hitchhikers Guide to the Galaxy- Box, Disk, Manual, & Stuff

Books:
Atari 800/800XL Programming Guides, Basic, etc.

Hardware:
Atari 800XL with Power Supply
Atari XM301 Modem With Box, Disk, & Instructions
Serial Printer Interface

I can also trade the following non-Atari Items

IBM Pc Jr. With Basic Cart and Mouse
Commodore 64 + 1541 Disk Drive
TRS-80 CoCo 2 & Carts
Apple IIc + Disks + Mouse

Please help me find what I need!

Thanks.

Howdy Mark

>does anyone know where I can find schematics to upgrade an xegs ram to at
>least 128K?

How about 1MB. Using a 30 pin SIMM?

I don't have the schematics ready yet (I'm still trying to get it to work on non-XEGS 8 bit Atari computers. But it works on my XEGS. No loss of BASIC, SELFTEST, OSRAM or MISSILE Command or even the separate ANTIC and CPU banking)

BTW I hope to have this ready before the yearly meeting of the ABBUC (German Atari 8 bit user group with opver 400 members world wide) on Ovtober 28th in Herten, Germany.

CU Mathy van Nisselroy

PS I can tell you in a few lines which chips you need an how to connect them, but no drawings yet and no "pin x of chip y to pin v of chip w" at this point.

You could try DirectX 7.0, but I don't know how much good this will do. I
actually don't have any problems with my Gravis Gamepad. My only problems
are software problems (if you know what I mean <<WIN 98>>) :P

Thanks for the suggestion. But my impression is that it works for
everyone else with DirectX 6.0, so I'm not sure why it doesn't for me.
This is with WIN95 by the way. If I remove the joystick device from
Windows, then Atari800WIn will run fine using the keyboard controls. I do
suspect the problem is more likely with the WIN drivers than with the
emulator! :)

OK, now I'm confused, I thought we were talking about the Yorkie
upgrade rather than the 1064, although they do both connect to the
PBI.

About the 130XE compatibility mentioned in a previous article in this
thread, the Yorkie claimed to offer (I say claimed 'cos I've never
owned one myself to test it, but I have seen one) full 130XE
compatibility, but you had to solder a couple of wires inside your XL
for that. It still worked without the soldering but wasn't 100% 130XE
compatible. I'd guess 100% compatible means ANTIC access to the extra RAM.

Sounds ideal to me. :)

Sorry, I currently use a strictly Atari400/AtariST setup, don't know
anything about joysticks on the Wintel platform.

However, on the Atari8/Atari16-32 platforms the way to correct a joystick
problem is to take the plug from the joystick and insert it into the joystick
port. ;)

2662. Re: Montezuma's Revenge, what's the point?

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-04 00:00:00 UTC
From: eplicon@wam.umd.edu
Message-ID: <8esai1fq1@dailyplanet.wam.umd.edu>
Source record: 45127

Thomas Richter (thor@math.tu-berlin.de) wrote:
: Hi folks,

: yesterday, I played again some of the old 8 bit classics and tried again
: the "Montezuma's Revenge" title. The long version that includes a title
: with a tiny animation at the beginning, not the 16K version.

: Does anyone know the point of the game? I managed it up to a room where
: I met "Montezuma", stomping with his foot. Two doors beside his head, one
: at the left side and one at the right side, a grey and a blue one. I
: opened both doors but --- nothing. Is there any specific point about
: this game, or is this supposed to be the "I win" situation?

I think the game was never completed the way it was meant to be. If you recall, Utopia Software displayed the game (probably a work-in-progress) at some convention show, and it caught the eyes of Parker Bros. They bought the rights to the game, re-wrote it (making the character more like Indiana Jones, to boot) and you could win once you reached the secret door.

It's been so long since I played that original version. But there is a neat trick, which I forgot how to do. When you get to the screen where the guy stomps, if you place Pedro at a certain point in the screen and jump, you will be able to enter the inventory section. This is where you can get extra swords or keys (providing you have at least one in the inventory). Then you jump away from the inventory box and get to kill more creatures for points. But that was as far as it would go, really. You could kill everything off and it still wouldn't get you any closer to a real finish. Anyway, you don't want to be fully in the inventory box. When you jump correctly, he will be halfway in there. If you jump up, you will be inside the box, and it will cause a real no-win situation. When you run out of time and the bat takes you away, you wind up back in the box, trapped! The trick is to jump to the left, so you wind back in the playing field.

2666. Help!!!!!!!!!!

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-04 00:00:00 UTC
From: atarigirl1983@aol.com
Message-ID: <20000504131830.01780.00001204@ng-fl1.aol.com>
Source record: 45131

Hi Everyone,

I need some help. I am a newbie to Atari 8-bit and I have the following hardware:

800 Computer
850 Disk drive
1030 Modem
1025 Printer

And Software:

Basic (cart)
Pac Man (cart)
Space invaders (cart)
Print Shop
DOS 3.0
Microsoft BASIC
...and a few others.

My problem is that I can't get my 810 drive to work. I have been told to get DOS 2.5 but no luck. It tries to read the disk but it just makes noises.

I also need help with my modem. What can I connect to? Can someone give me some commands/addresses to use because I would really like to use it for something.

I also need help with the printer. Of course I cannot print anything as I don't have a program on cartridge that has print commands. I also need an ink roller for it.

As you can see I really need some help as a begginner, I just bought my 800 in Febuary and I love it to death. I never thought an old PC could be so much fun, but I REALLY need to learn how to use this thing. Can someone help me???

Thanks,

Jessica C

Fashbacks to Gyrus. I got so obsessed with beating this game that I built my
own rapid fire joystick and adjusted the firing rate to be game specific.
That still wasn't enough, so I would hit the space bar every 5 seconds or so
to pause the game so I could get my strategy right. When I finally made it
all the way to earth, the game just started over at Pluto<?>.

I don't mind open ended games, things like Donkey Kong or Pac Man are fine, but when you have a certain type of formats you should get a rating or "Congrats!" or something. Star Raiders is a good example of a satisfactory ending to a game with its ranking system.

Depending on how the disk was formatted, the DOS 2.5 and DOS 3.0 may be in
enhanced density which an 810 won't do. You need a disk formated in single
denssty with DOS of choice. DOS 2.5 is probably the best DOS Atari came up
with, but a lot of people like MyDOS or Sparta DOS.

Personally, I've always liked DOS 3.0, since it always seemed to
be a much slicker, more professonional product. Of course, it
eats excessive RAM.

My recommendation for testing the drive would be to try it with
a commercial disk if possible. Commercial software was almost
always on single-density disks, and it's easier to rule out
human error if you can just pop a commercial SD game in the drive,
turn the computer on, and see if the software loads.

2676. FS/T: Atari 400 - UK

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-04 00:00:00 UTC
From: Edward Scissorhands <EdwardS@lovecraft.demon.co.uk>
Message-ID: <UkjDPrCovZE5EwN6@lovecraft.demon.co.uk>
Source record: 45141

Swap for 800XL or XEGS - Atari 400 with proper keyboard (one keytop is missing, they look like 800 keys so a replacement shouldn't be impossible to find), 410 recorder, BASIC cartridge, PSU. Originally a 16K version, upgraded to 48K, looks in good condition but I haven't cleaned it, as it has a sticker saying 'Atari Home Computers' on it which I didn't want to disturb.

It also has a very scruffy Atari Basic guide with pictures of the 400 on, which doesn't appear to be a manual as such, but a 3rd party book.

It gives a much better picture on a TV than my 65XE does, but I prefer the look of the XEGS to the 400 series!

There is always a way to do almost anything if you want it bad enough... You just need to do a lot more homework that way. You do not have valid data for a period of time on D0-D7, so you need some sort of delay before you activate EXTSEL. This is probably OK since you can let RAS run on every cycle as long as you kill CAS before it is brought up by the clocks. Use an 8 input NOR gate to generate the EXTSEL -- you will probably be close.

I really did it using all SRAM because I am working on sharing the memory between two systems. There you need all SRAM.....

I checked my joystick connection, it was okay.
I checked my installation of Atari800Win, reinstalled it and it still works.
I checked my Windows 95 game controller settings, it is okay.
So why can't I play Microsoft Return of Arcade with my joystick anymore?
So why can't I play Microsoft Revenge of Arcade with my joystick anymore?
Why can't I play my licensed editions of shareware game titles with my
joystick anymore?
I want ALL of my games to work with the appropriate controls!
I decided to start using an emulator because my Atari 1050 Disk Drive gave
up the ghost.
Please tell me how to get my Gravis PC Pro Joystick to work on ALL my PC
games again.

I never owned a 810, but the 1050 has a drivenumber switch in the back.
Make sure it's set to one (D1: drive 1) if the 810 has one (does anybody
know (sure somebody does :-)).

The 800xl parallel bus doesn't have +5v on the parallel bus. the 600xl
does.
The 1064 will not connect to the 800xl because the opening in the
plastic case is narower. the 1064 has 2 clips that supossadly clip
onto the wider opening of the 600xl. They don't work all that well .

The Drive was Single density only, find almost any old atari disk game
(almost all were single density) and give it a whirl. It should boot. (or
tell you to take the basic cart out).

where abouts are you? If your UK i could find a spare copy for you, dont trust international post though (Xrays can cause data damage, its rare but realy not worth the risk in my opinion).

you will need a terminal program. once you have one you may be able to establish a telnet session with your PC (if you have one) or to one of the bulliten boards. There seems to be a monthly listing/faq that may help with that.

From: rob@syroxdev.co.uk
Message-ID: <3912f31b.138450@news.supernews.com>
Source record: 45057

Hi there,

I've recently acquired a couple of 1050 drives and while mucking around with a SIO2PC cable I've managed to kill one of them.

While one drive is perfectly happy to do anything I ask it I just get an error 160 from the other.

Could someone give me an idea as to what I should be looking for in terms of undertaking a repair please?

I've not opened the dead drive up at all as yet so I don't know whether it's possible to swap some componants between the drives easily.

If anyone can help I'd appreciate it a lot.

Thanks in advance.

RB.

>"Jeffrey Taylor" jbcktaylor@erols.com opines:

>what the major bug is in Atari BASIC Rev.A? Just curious.

the MAJOR & most serious and inconvenient bug involved editing BASIC
statements. Changes to the statement table which required moving a multiple of
(IIRC) 256 bytes could 'lose' some of your program or more commonly 'lock' the
system; this 'freeze' survived system reset and required a cold start to clear.
Prudent coders listed all to tape or disk after almost every line during heavy
editing to avoid that helpless empty feeling and a lot of retyping.

>roller for it.

I agree with "check Best or B&C for roller", but you can print from BASIC with
either:
LPRINT "any text here...."
or OPEN #1,8,0,"P:" : PRINT #1,"text..."

The BASIC cartridge supports several print commands.

The 1030 is a solid & capable (& very slow) modem with the proper software;
otherwise a little arcane to use. Check the Antic site for some info &
articles:
http://www.atarimagazines.com/

Print Shop was in your list; and it comes on a single density disk suitable for
the 810. Will it boot when you start the 800 without BASIC?

160 is a bad drive number error???
Many chips are socketed in my 1050; don't know if that was standard from all sources. The larger chips near the center of the circuit board under the drive mechanism are the main controller and personality stuff. Can't offer much help beyond that except make a diagram and put tape labels on all the chips BEFORE you start swapping around!

-Ron

I don't have a solution but I admire the problem.

2699. Re: Rainbow chip?

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-05 00:00:00 UTC
From: Atari History Site Webmaster <webmaster@atari-history.com>
Message-ID: <391359E5.E6CF357E@atari-history.com>
Source record: 45066

Hi Iain,

Rainbow was a new chipset that Atari was working on for the "GAZA"
project, it was a new system that would have competed with Sun Microsystems
and for production video services. Originally Warner Management liked the
whole concept and gave the go ahead, after an initial set of prototypes
were made Warner again changed its mind and felt it would conflict with
Atari's need to focus as an entertainment only company and the project was
scrapped. A sister project which went even farther was the "SIERRA"
project which had a new chipset called Silver & Gold, the chips were
codenamed MARIA (not to be confused with the MARIE chip in the Atari 7800)
and AMY and utilized 2 MC68000 on a single bus. The system was demo'd in
late 1983 to a select group of reporters and in an audio demo the system
produced the sound of an male opera singer and then a female. The
Tramiels attempted to mate the AMY chip with a 65XE computer system.
However they fired all of the Atari Institute and Atari Corporate Research
staff that created the chipset and its doubtful that they were ever able to
full decypher its full working and they were never able to get it to work
the way it was originally designed.

If the stick/pad is installed and calibrated correctly, the next thing
to try would be a reinstall of DirectX. If that fails, delete Windows
from your hard drive and reinstall it, followed by a version of DirectX
that has worked for you in the past.

Post the votages you get at each pin, turn on the verbose mode of the
software on the PC side so it shows you things like command line going low.
You'll know the menu when you get it up.

The voltages with both the Atari and the IBM turned on should be the only
ones you need to get.

No... but my wish has always been that Atari had released a machine with
Amy and the 7800's MARIA while maintaining compatibility. That would
have made the Tramiel era almost bearable.

I would start with the 3086 chip in the back righthand corner.
This chip buffers the sio bus.

Error 160 is a device error also known as "invalid drive" and usually indicates a problem in the CIO disk handler aka DOS. If you're using one of the older, dumber DOS, you may have to set a bit in DRVBYT at $070A (decimal 1802) to indicate the presence of the drive. If you are using one of these DOS, for test purposes, go to BASIC and enter the following (make sure you have an unprotected DOS disk in D1:):

```
POKE 1802,255
CLOSE #1
OPEN #1,8,0,"D1:DOS.SYS"
CLOSE #1
BYE
```

When you get the self-test screen, hit Reset and the computer will reboot with DOS set for eight drives. Note this is for Atari DOS 2.x and any of its clones (TopDOS, SmartDOS, MachDOS, DOSXL, SuperDOS, older MYDOS).

Before assuming the drive needs surgery, try the obvious: set it to D1: and try it alone on the computer. If that works, try adding the second drive as D2: (make sure the switches are set correctly). Do these tests without SIO2PC attached.

Then add the SIO2PC cable and run the software on the PC without loading or creating any disk images and try your real drives again. If both work, fine; if not you may have a computer which can't handle that many devices on the SIO buss--I had a 130XE which could not handle more than two, SIO2PC or a printer interface would cause the drives to crap out. The solution I adopted, which most hardware types will tell you is a "no no", was to change cables on the go.

If changing the DOS DRVBYT fixed things, get a better DOS. SpartaDOS is the most powerful but, if you're not comfortable with a MS-DOS-like command line, use MYDOS 4.53.

Hi,

I've had my 800 and 800xl for about 11 years now...
even tho I have had the DD disk drives, I've been stuck using the SD format, due to the OLD O.S. , I had the manual for the new os, but I never could find the software...

Is anyonw able to supply me a copy of this program?
Id gladly pay for shipping/disk...

Thanks,

-Clint

Subject: 1.1) What is an Atari 8-bit computer?

400 800 1200XL 600XL 800XL 65XE 130XE 800XE XE Game System

Here is a very condensed history of Atari, centered around their 8-bit computers.

1972
Atari Inc. is formed by Nolan Bushnell, incorporated on Tuesday, June 27. Atari created the first coin-operated arcade video game with the introduction of Pong. The video game industry was launched and has shaped pop culture ever since.

1976
Warner Communications acquires Atari Inc.

1977
Atari launches the Video Computer System (VCS), later known as the 2600, giving birth to home video game systems.

1978
In December, Atari announces the Atari 400 and 800 personal computers, using the 6502 microprocessor. The Atari 800 was code-named "Colleen"; the 400, "Candy."

The following are most of the team who originally designed the 400/800.
Credit for providing this information for the FAQ goes to:

VLSI HARDWARE:
Jay Miner - Creator and System architect, VSLI manager
Steve Mayer - Also one of the creators - Partner in "Cyan Engineering"
Lawrence D. Emmons - Also one of the creators - Partner in "Cyan Engineering"
Joe Decuir - ANTIC and system and creator
???A French guy - ANTIC logic designer
George McLeod - CTIA and GTIA logic design
Doug Neubauer - POKEY logic design
Mark Shieu - POKEY chip design
Steve Stone - POKEY layout design
Steve Smith - Technician for ANTIC and GTIA
Delwin Pearson - Technician for POKEY

OS PROGRAMMERS:
Larry Kaplan
David Crane
Bob Whitehead
Al Miller

1979
The Atari 400 and Atari 800 Home Computers debut at the Winter Consumer Electronics Show (CES) in early January.

Jerry Jessop, mailto:jjessop1@home.com writes:
"The first official small shipment of the 400/800 was on August 29th 1979. These were hand built pilot run units to Sears that needed to be in stock by Sept. 1 so they could be placed in the big fall catalog. The units were placed in the Sears warehouse and then immediatly returned to Atari after the "in stock" requirment had been meet.

The first "real" consumer units were shipped in Nov. of 79 and were 400's to Sears followed very shortly by 800's."

These MOS Technology 6502-based systems run at a clock speed of 1.79 MHz, offering 128 colors displayable simultaneously, up to 320x192 graphics resolution and up to 40x24 text resolution in 8 graphics modes and 6 text modes. Video may be displayed either on a composite video monitor in the case of the 800, or on a standard television for both systems. 4 independent sound voices are available through the audio output of the television or monitor, each with a 3 1/2 octave range, plus there is a built-in speaker for key-click and other programmable sounds. The 800 has a second cartridge port and a full-stroke keyboard, while the 400 has a single cartridge port and a membrane keyboard. Each has 4 serial controller ports and an Atari Serial Input/Output port. Originally, both the 400 and 800 were sold with 8K RAM, but later most 800's were sold with 48K and 400's with 16K. Each includes the 10K Atari Operating System in ROM.

The 800 can be fitted with 1-3 of the following two RAM modules:
CX852 8K RAM module, CX853 16K RAM module
and must be fitted with a ROM module:
CX801 10K ROM, CX801-P 10K ROM for PAL machines

[WHEN WAS THE 400/800 REVISION B OS INTRODUCED????]

1981
November: 400/800's begin shipping with the new GTIA chip in place of CTIA, increasing the palette of simultaneously displayable colors to 256 and adding 3 new graphics modes. CTIA is totally phased out by the end of the year.

Jerry Jessop, mailto:jjessop1@home.com adds:
"The very first proto systems did have the GTIA, but it had some problems and was not released in the consumer version until 1981. The GTIA was completed before the CTIA."

1982
The introduction of the 1200XL in late 1982 marks the single largest advance in the 8-bit Atari system. The 1200XL runs most software and hardware designed for the 800 and 400, but now runs a slightly more advanced 6502C microprocessor, and includes a full 64K RAM. The single cartridge and monitor ports remain, along with 2 controller ports. In addition, the 1200XL includes 4 programmable Function keys and a Help key, built-in diagnostic and graphics demonstration programs, and probably the favorite keyboard of any 8-bit Atari computer. Clicks previously outputted through the built-in speaker are now

heard from the television or monitor's speaker. The revised 16K Operating System offers many new features, including an alternate International Character Set.

1983
In 1983 Atari replaced the 1200XL/800/400 line-up with the new 800XL and 600XL. These new machines include most of the features of the 1200XL minus the Function keys and the demo program. But now both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Buss Interface (PBI), providing fast parallel access to the heart of the computer. The 800XL contains 64K RAM while the 600XL has 16K RAM.

The 600XL can be expanded from 16K to 64K with the 1064 Atari Memory Module.

1984
Warner Communications sells Consumer Electronics and Home Computer divisions of Atari Inc. to Tramiel Technologies on Monday, July 2.

Atari Corporation is formed by Tramiel Technologies and its products marketed under the Atari brand.

(
Atari Games Corporation is also formed from the former coin-op division and markets coin-op games under the Atari Games brand.

Atari Games Corporation is a developer, marketer, licensor and publisher of coin-operated video games, having created such classics as Pong, Asteroids, Centipede, Missile Command, Gauntlet, Area 51, and San Francisco Rush Extreme Racing. Atari Games Corporation is a brand of Midway Games Inc. (NYSE:MWY). The Atari Games home page is at http://www.atarigames.com.
)

1985
The new Atari Corp. delivered on its promise to advance the 8-bit Atari system by replacing the 800XL/600XL with the new 130XE and 65XE in 1985. The 65XE is nearly identical to the 800XL in features, minus the PBI. The 130XE, however, offers 128K RAM, plus the FREDDY chip, supporting the unique (but rarely used) ability for the 6502C and the ANTIC to independently access RAM banks. In addition, the 130XE replaces the PBI port with the Enhanced Cartridge Interface (ECI), continuing the powerful feature of a fast parallel port. European 65XE's include the ECI port.

Only by the final production run of the 130XE (when was this???) was the XL/XE OS revised to include a "keyboard test mode" that matched the XE keyboard, and a RAM test that tests the full 128K of RAM.

1987
In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system. It offers the convenience of a detachable keyboard and built-in Missile Command game (hold down Select at startup), while offering 64K RAM and full compatibility with the 65XE.

The 800XE, a 130XE with just 64K, was released at some point in eastern Europe. [WHEN???]

1992
Atari officially dropped all remaining support of their 8-bit computer line on January 1, 1992.

1996
On July 31, 1996, Atari Corp. became a JTS subsidiary. JTS Corp., with headquarters in San Jose, Calif., was founded in 1994 to design, manufacture and supply enhanced-capacity hard disk drives for the notebook and desktop personal computer markets.

1998
On February 23, 1998, JTS sold its Atari Division to HIACXI Corp., a wholly-owned subsidiary of Hasbro Interactive, Inc., which is a subsidiary of Hasbro, Inc., for $5 million in cash.

TODAY
Hasbro is a worldwide leader in the children's and family leisure time and entertainment products and services, including the design, manufacture and marketing of games and toys ranging from traditional to high-tech. Both internationally and in the U.S., its PLAYSKOOL, KENNER, TONKA, ODDZON, SUPER SOAKER, MILTON BRADLEY, PARKER BROTHERS, TIGER, HASBRO INTERACTIVE, MICROPROSE, GALOOB and WIZARDS OF THE COAST brands and products provide the highest quality and most recognizable play experiences in the world.

Hasbro Interactive, Inc. is a global interactive entertainment industry leader, innovating new ways to play and developing, publishing and distributing the highest quality interactive games and lifestyle products for a full range of genres and platforms. A subsidiary of Hasbro, Inc. (NYSE: HAS - news), Hasbro Interactive has offices in the U.S., U.K., Canada, Germany and Australia, and internal development studios in the U.S. and U.K. For further information, visit Hasbro Interactive's Web site at http://www.hasbro-interactive.com.

Atari Interactive, Inc. is a Hasbro affiliate, online at http://www.atari.com/

Atari currently (4/00) markets:
Atari Arcade Hits 1 & 2
Centipede
Frogger
Glover
H.E.D.Z. - Head Extreme Destruction Zone
Missile Command
Nerf ArenaBlast
Pong
Q*Bert
The Next Tetris

Subject: 1.2) What are the some of the performance features of the 8-bit Atari?

E 15 ++ Map 160 x 192 4
F 8 Map 320 x 192 1 *
F 9 + Map 80 x 192 1 **
F 10 + Map 80 x 192 9
F 11 + Map 80 x 192 16 ***
* 1 Hue; 2 Luminances
** 1 Hue; 16 Luminances
*** 16 Hues; 1 Luminance
+ require the GTIA chip. 1979-1981 400/800's shipped with CTIA
++ Not available via the BASIC GRAPHICS command in 400/800's.

GRAPHICS INDIRECTION (COLOR REGISTERS AND CHARACTER SETS):
Nine color registers are available. Each color register holds any of 16
luminances x 16 hues = 256 colors. (Four registers are for player-missile
graphics.

Character sets of 128 8x8 characters, each with a normal and an inverse video
incarnation, are totally redefinable.

PLAYER-MISSILE GRAPHICS:
Four 8-bit wide, 128 or 256 byte high single color players, and four
2-bit wide, 128 or 256 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also
available, as is a mode to XOR colors or blacken out colors when players
overlap (good for making three colors out of two players!) Players
and missiles have adjustable priority and collision detection.

DISPLAY LIST INTERRUPTS (DLI's):
Screen modes can be mixed (by lines) down the screen using the Display List - a program which is executed by the ANTIC graphics chip every screen refresh:

All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via DLI's.

SCROLLING:
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.

SOUND:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution, 8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.

A fifth "voice" is produced by the internal speaker on Atari 400/800's (for keyclick and buzzer) and in the XL's and XE's this was (fortunately!) rerouted through the normal audio output, and the keyclick can be disabled.

Subject: 1.3) What is the internal layout of the 8-bit Atari?

The following four paragraphs were written by Chris Crawford and appear in De Re Atari (Atari#APX-90008), a book published and copyright by Atari, Inc., 1981-1982. The text been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different from other systems. It of course has a microprocessor (a 6502), RAM, ROM, and a (PIA). However, it also has three special-purpose (LSI) chips known as ANTIC, GTIA, and POKEY. These chips were designed by Atari engineers primarily to take much of the burden of housekeeping off of the 6502, thereby freeing the 6502 to concentrate on computations. While they were at it, they designed a great deal of power into these chips. Each of these chips is almost as big (in terms of silicon area) as a 6502, so the three of them together provide a tremendous amount of power. Mastering the Atari 8-bit computers is primarily a matter of mastering these three chips.

ANTIC ("Alpha-Numeric Television Interface Circuit") is a microprocessor dedicated to the television display. It is a true microprocessor; it has an instruction set, a program (called the display list), and data. The display list and the display data are written into RAM by the 6502. ANTIC retrieves this information from RAM using direct memory access (DMA). It processes the higher level instructions in the display list and translates these instructions into a real-time stream of simple instructions to GTIA.

CTIA ("Color Television Interface Adapter") / GTIA ("George's Television Interface Adapter") is a television interface chip. ANTIC directly controls

most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missile graphics, and collision detection.

POKEY (means "POT and KEY" as in the paddles and keyboard) is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

While the 400/800 models contain a generic 6502 CPU, all of the XL/XE models contain Atari's customized 6502C chip. Alan Manuel K. Gloria, mailto:mani@pworld.net.ph writes:

The difference goes something like this: On the Atari, there are two microprocessors, ANTIC and the 6502 or 6502c. To allow them to coexist, ANTIC must shut off the 6502/6502c, a process called DMA. The 6502 supports DMA, but in Atari's implementation, it required 4 chips. The 6502c has this additional circuitry built-in.

More on this from James Bradford, mailto:sup8pdct@mail.cth.com.au :
The 6502c in all PAL atari's, late 400/800, XL, XE NTSC atari's have a special 6502. This 6502 has an extra line called HALT. It is controlled by ANTIC which it uses whenever it needs the data/address bus. The HALT line is on pin 35 of the atari 6502 and must be pulled high for the chip to work (I think) . Early 400/800 NTSC atari's used a standard 6502 and a couple of chips to stop the processor when antic needed the busses

The 130XE and XEGS contain a small additional LSI called FREDDY, a RAM address multiplexer. According to mailto:sup8pdct@mail.cth.com.au (James Bradford), "FREDDY is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. FREDDY also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a FREDDY but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from FREDDY, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to FREDDY for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say FREDDY does the bank

switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO FREDDY) and an extra 8 RAM chips."

And more recently James Bradford has written:
Freddy is just a memory decoder and timer. It replaces several chips in the 800xl The small chip near freddy does all the bank selection. CO25953. One line from freddy , Ras (or is it cas?) goes to this chip, Halt and the bank /processor select lines go into this same chip and ras (cas?) comes out. a pin for each bank. If i remember correctly, refresh also goes into this small chip. It would be quite easy to make an 800xl work just like a 130xe with this chip since Ras (Cas?) is required by ALL dynamic ram.

Some words on GTIA bugs, from Andreas Magenheimer,
mailto:magea000@mail.uni-mainz.de :

All of these newer and buggy GTIA`s were built with the "eastern european" XE computers. they were made in China. Although Atari knew about this, they did not change them. so you have to replace them with older XL/XE GTIA chips...

But one more thing to GTIA and Antic chips: All PAL versions of these chips have a color bug, since gr. 11 produces 16 colors, but merely 15 different colors (one color: brown at the beginning and end of the palette is absolutely the same; normally there should be a red tone here !); with gr. 9 you will see 16 shades, but merely 15 different shades (the same as gr. 11, one shade is doubled!).

Strange enough, I also found this color bug to appear in PAL Antic chips, there is also the red tone missing (and the brown one doubled !). This color bug appears in all PAL Antic and especially GTIA chips. Atari never fixed it, so you find it inside any GTIA equipped PAL Atari 800 and also the later XL and XE models. Since PAL users have to live with this bug, they sometimes do programs which look absolutely strange on NTSC and vice versa (not to mention the different Herz frame 50/60 hz and higher PAL line resolution/overscan).

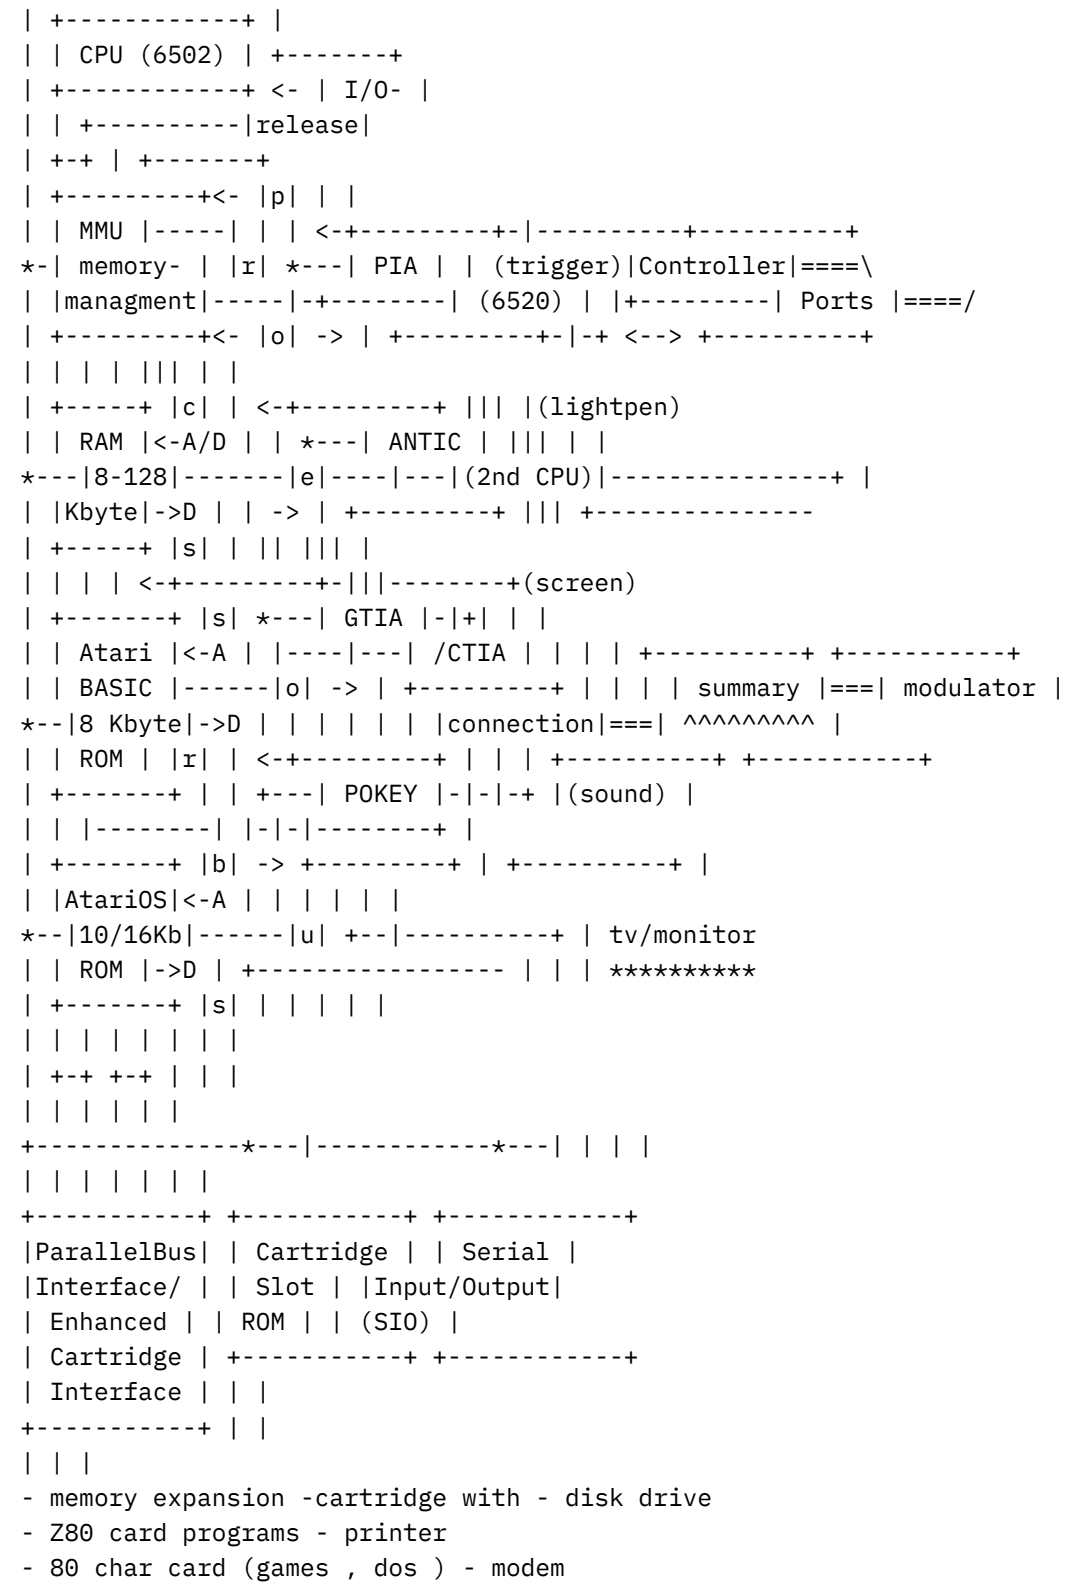
Imagine the following: a PAL GTIA has 15 colors in gr. 11
a NTSC GTIA has 16 colors in gr. 11
a PAL GTIA has 15 shades in gr. 9
a NTSC GTIA has 16 shades in gr. 9

Thus, a combination of gr. 9 and 11 gives:
16x16 = 256 colors on NTSC
15x15 = 225 colors on PAL

And - as said before, the bug seems also to appear with Antic...
Bad luck, we PAL users... Greets - Andreas Magenheimer.

Hardware Arrangement (With thanks to mailto:twh@bigfoot.de (Thomas Havemeister))

->
+--------------------------------------+



- memory expansion -cartridge with - disk drive
- Z80 card programs - printer
- 80 char card (games , dos) - modem

NOTES
* RAM: 400/800: 8K, 16K or 48K standard
600XL:16K standard
1200XL/800XL/65XE/800XE/XEGS: 64K standard

130XE:128K standard
* ROM: 400/800:10K OS, 1200XL:16K OS, all others:16K OS + 8K Atari BASIC
* CPU: 400/800:6502, all others:6502C
* 800 includes two Cartridge Slots, all others include one
* early release 400/800 have CTIA instead of GTIA
* 400/800 have 4 Controller Ports, all others have 2
* PBI is on 600XL/800XL only
* ECI is on 130XE/800XE only

Technical data and schematics for the Antic, GTIA, and POKEY chips are available on Curt Vendel's web site, thanks to permission from Hasbro's Atari Interactive Divisions release of this data. See:
http://www.atari-history.com/articles.html

Subject: 1.4) How did Atari get it's name?

Graham Thornton, mailto:dangermouse@prodigy.nospam.net types:

This article was published in "I/O - The Magazine of the Atari Home Computer Club" in issue 3 - Summer 1983. The magazine was the official mouthpiece of Atari UK. The article was not attributed to any one person. The words are thiers, not mine.

How Atari Got It's Name

The name Atari actually comes from Japan. And yet the company is most definitely American. Every wondered why? It's an interesting story and one well worth telling.

In 1972 three friends decided to invent and market the first commercially feasible video game. They were Nolan Bushnell, Ted Dabney and Larry Bryan.

To become a partner each man had to submit $100 to the project - a remarkably small sum when you consider the company's success! The next step was to find a name.

Drinking beer and thumbing through the dictionary one day, the three friends came across an interesting entry under "S". The word was Syzygy, or "the straight-line configuration between three celestial bodies". What a perfect name they thought, for three such astronomically talented people!

Now they could get on with the business of inventing games. Their first, Computer Space, was produced and all seemed to be going well.

But then things started to get a little shaky. Larry Bryan decided not to ante up his $100 and pulled out, leaving Bushnell and Dabney to go it alone.

The set up a shop in Santa Clara, California, and incorporated the business. A little later they invented Pong(r).

Busnell and Dabney applied for the name Syzygy to the Office of the California Secretary of State, which regulates Californian corporations, but were told that they were too late. The name was already taken.

Following unsuccessful attempts to buy the rights to the name from the first Syzygy corporation, which appeared to be inactive, the friends' solicitor pressed them to think up an alternative.

This proved difficult. BD Inc and DB Inc were tested and then rejected in turn: the first bore too close a resemblance to Black & Decker, the second to Dunn and Bradstreet.

Inspiration occurred at last, once again in an informal atmosphere. Bushnell and Dabney were both keen players of Go, a Japanese strategy game, and their best brainstorming always occurred over a good game and a bottle of beer.

This time, they decided to make a list of several Go words to see if one of them would fly as the new corporate name.

First choice was "Sente", which means "the upper hand" - something that greatly appealed. Second and third choices were "Atari", which has a similar meaning to the English word "check", and "Hanne", an acknowledgement of an over-taking move.

Busnell and Dabney submitted the list once again to the Office of the Californian Secretary of State, which approved "Atari". The rest is history.

When the company name changed, Bushnell and Dabney decided to update the logo too. They incorporated the "S" from Syzygy and the "A" from Atari into the new design.

It was not until later, as the company became increasingly successful, that an advertising agency designed the slicker and now famous Atari logo - the "fuji" or stylised "A" design.

Subject: 2.1) What is comp.sys.atari.8bit?
4/00
news:comp.sys.atari.8bit is the unmoderated Usenet newsgroup for discussion about the Atari 8-bit family of computers, including the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE and the XE Game System!

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st.

Large binary posts do not belong in unmoderated discussion groups like comp.sys.atari.8bit. If you wish to share PD/freeware/shareware, use alt.binaries.atari or alt.binaries.comp.atari8bit, or upload the software to the University of Michigan Atari Archive.

To the best of my knowledge, there is no charter for comp.sys.atari.8bit, presumably because the custom of drafting charters for new newsgroups did not

exist at that time.

Subject: 2.2) What other Usenet newsgroups cover the 8-bit Atari?
4/00
news:comp.sys.atari.advocacy
Attacking and defending Atari computers. Unmoderated.

news:comp.sys.atari.announce
Announcements of Atari-related hardware and software, Web sites and other
Internet resources, and events
Moderated by Kevin Savetz, mailto:savetz@northcoast.com
Archived at http://www.savetz.com/csaa/

news:comp.sys.atari.programmer
Programming on the Atari computer. Unmoderated.

news:rec.games.video.classic
Orphan home video game systems. Unmoderated.

news:comp.emulators.misc
Emulating one kind of computer on another. Unmoderated.

news:comp.emulators.announce
Announcements related to computer emulators.
Moderated by Qualcomm, mailto:emulators-request@qualcomm.com

news:alt.binaries.atari
uuencoded software for Atari computers. Unmoderated.

news:alt.binaries.atari.d
Descriptions/discussions on software posted on alt.binaries.atari. Unmoderated.

news:alt.binaries.comp.atari8bit
uuencoded software just for the 8-bit Atari. Not widely available.

Subject: 3.1) What is ATARI8-L?
4/00
From the ATARI8-L hope page at http://atari.ideefixe.nom.pl/

atari8-l is probably world biggest mailing list about 8-bit atari
computers. it's connected bidirectionally with old INFO-ATARI8 mailing
list at MARIST, as well as gatewayed to FidoNet (tm) ATARI8-L
international echo. it was created about two years ago to help ANIX
project (unix for 8-bit atari), but it quickly became international
forum for all 8-bit atari users.

for now the list has over the 100 subscribers from all around the world:
simple users, hardware developers, famous programmers or atari scene
members - discussing about their machines, new and old software,
hardware, upgrades, plans, and all atari gossip. there are no
ForSale/Trade messages, no spam, no off-topic discussions - so the list

is the essence of the 8-bit related traffic in the internet.

how to subscribe?

the fact, that atari8-l is a mailing list, not a usenet newsgroup, simplifies few things to users, that still use their favourite small computers for networking - all messages comes right into mailbox, no distant-newsserver connections is needed, as well as there are no old-messages-deleting problems. you can read it all using your favourite mail reader, using every account that'll support email sending/receiving.

to subscribe, simply mail a message to mailto:majordomo@listserv.ideefixe.nom.pl, with the following line in the body (not the subject) of the message:

subscribe atari8-l

the language we use on the list is english. try to stay on-topic (if you'd like to make some off-topic comments, please do so by private email to poster). all posts to the list should be in plain ascii (please, do not use any HTML tags, nor UUENCODE, MS/TNEF additions) - all these added junk is unreadable for any non-windows user (like atari user, or one who use un*x operating system).

archive

the list is also available as an usenet newsgroup listserv.atari8-l on newsserver news.ideefixe.nom.pl (you may try the following URL, if your browser supports NNTP connections: news://news.ideefixe.nom.pl/listserv.atari8-l). that newsgroup is almost complete archive of all the messages that appeared on the list (for the complete one, you may try fetching from the majordomo - please use the help command to see all available functions.

questions? problems?

if you have any questions or problems regarding the mailing list or that webpage, please inform me ASAP - my email address is mailto: krap@zwieracz.ideefixe.nom.pl.

maciej grzeszczuk

Subject: 3.2) What is ATARI8PL-L?
4/00
A Polish language version of the ATARI8-L list.

to subscribe, please mail a message to mailto:majordomo@listserv.ideefixe.nom.pl

containing a line:

subscribe atari8pl-l <mailing address you'd like to receive the list to>

in the body (not the subject) of your message

if you get any problems, please report to
maciej grzeszczuk, mailto:krap@zwieracz.ideefixe.nom.pl

Subject: 3.3) What is the Atari8development list?
4/00
From: "arudzki" <arudzki@home.com>
Date: Sat, Oct 30, 1999 2:55 PM

Hello Developers,

Since I'm starting some development on a couple of projects for the 8-bit, I thought I would take someones advice (can't remember who...) and start up an e-mail mail list to link up similar developers.

I like reading the posts on the newsgroups and the atari mailing list, but I thought there could be a use for an e-mail list used for linking and sharing ideas on new or improvements on existing 8-bit projects.

To subscribe just click on the link below and SEND. Theres no need to put anything in the subject or body of the letter. Soon after, you'll get a confirmation e-mail, which you just reply to....and you're IN!

Posting to the group is at the address below, also.

Community email addresses:
Post message: Atari8development@onelist.com
Subscribe: Atari8development-subscribe@onelist.com
Unsubscribe: Atari8development-unsubscribe@onelist.com
List owner: Atari8development-owner@onelist.com

See you soon!

Tony

Subject: 4.1) What is XL Search?

XL Search is a web- and e-mail-based search engine. With it, you can search numerous Atari FTP and websites for programs for, and documents related to, Atari 8-bit computers.

(This includes the Atari 400, 800, 800XL, 600XL, 1200XL, 800XE, 65XE, 130XE and XEGS, as well as the numerous Atari 8-bit computer emulators for DOS, Windows, Unix, Macintosh, Amiga and Atari ST/TT computers.)

Where Is It?

XL Search can be accessed via the web at:

http://xlsearch.atari.org/

or:

http://www.newbreedsoftware.com/xlsearch/

An e-mail gateway is available as well! Simply send a blank message to:

xlsearch@newbreedsoftware.com

An automated reply will explain how to use XL Search via e-mail.

XL Search has now exceeded the 20,000-file mark! Almost 10 different
Atari 8-bit file collections are indexed!

-bill!
bill@newbreedsoftware.com
http://www.newbreedsoftware.com/

(By the way, the UMich site is also indexed at http://shareware.com/.)

Subject: 4.2) What is the University of Michigan Archive?

The University of Michigan (UMich) Software Archives hold a huge number of
files for many computing platforms, including the Atari 8-bit computers. For
more information:

Bill Kendrick, mailto:bill@newbreedsoftware.com (8-bit Atari files)
Mickey Boyd, mailto:boydm@atari.archive.umich.edu (the entire Atari Archive)
Michael Dautermann, mailto:myke@umich.edu (the entire UMich Software Archives)

Downloading

There are numerous methods available for downloading files from the UMich
Archive. The Archivists request you use these mechanisms in this order of
preference:

1) The number one way to get into the UMich archives is via AFS. If you have
AFS, all our files are kept in the directory
"/afs/umich.edu/group/itd/archive". If you have AFS, PLEASE USE IT!
Specifically, use:

file:///afs/umich.edu/group/itd/archive/atari/8bit/

2) Gophering to gopher.archive.umich.edu and looking under the "Software
Archives" choice. Specifically, use:

gopher://gopher.archive.umich.edu:7055/11/atari/8bit/

There are also mirror Gopher servers:
gopher://wuarchive.wustl.edu:70/11/systems/atari/umich.edu/8bit/
gopher://sunsite.doc.ic.ac.uk:70/1/0-Most-Packages/atari/umich/8bit/

3) The WWW interface is fine, at this point. http://www.umich.edu/~archive/
Specifically, use:

http://www.umich.edu/~archive/atari/8bit/

Mirror web sites:
http://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/
http://wuarchive.wustl.edu/systems/atari/umich.edu/8bit/

4) FTPing to atari.archive.umich.edu and looking in the "8bit" subdirectory.
Specifically, use:

ftp://atari.archive.umich.edu/atari/8bit/

The atari.archive.umich.edu FTP site is chronically overloaded, but there are
several mirror sites which are all updated from the home site regularly:
ftp://wuarchive.wustl.edu/systems/atari/umich.edu/8bit/
ftp://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/
ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit/
ftp://barnone.citi.umich.edu/atari/8bit/
ftp://ftp.kendall.mdcc.edu/pub/atari/umich.edu/8bit/
ftp://pmftp.cs.vu.nl/pub/atari8bit/

Brief FTP tips:
- user name is "anonymous"; password is your e-mail address
- Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

5) E-Mail <-> FTP gateways. See the section of this FAQ list entitled "How do
I access Usenet, FTP, Gopher, and WWW by e-mail?

Uploading

Bill writes:
If you're lucky enough to get into this archive via FTP, please upload
(with the appropriate translation ("ASCII" for text files, "BINARY"
otherwise)) your additions into the "New/" directory.

If you can only access this archive via Gopher, the Web or some other
uni-directional way, please e-mail additions to:

mailto:bill@newbreedsoftware.com

Please encode your files with UUencode or MIME ("base 64").

Always remember to upload a ".blurb" file to describe what you've
uploaded. And if there's a specific place you think the file should
go, please mention it in the ".blurb" and/or in an e-mail to me.

Please keep your ".blurbs" short, however. (1/2K or less!)
If you have text documents for the program, include them in an ARC file
with the program, or send them seperately as a ".TXT" file.

Thanks!

Subject: 5.1) What is the National Capital FreeNet Atari Users SIG?

Internet access to the National Capital FreeNet (Ottawa, Ontario, Canada):

telnet://telnet.ncf.carleton.ca (Type "go atari" at any menu) or
gopher://gopher.ncf.carleton.ca or
http://www.ncf.carleton.ca/

Contact:
mailto:ac382@freenet.carleton.ca (Jack Kitowicz) or
mailto:aa728@freenet.carleton.ca (Blair Dea)

Subject: 5.2) What is the Closer to Home BBS?

A BBS running BBS Express! Pro by Video 61 for the 8-bit Atari, available on the Internet via telnet! Running in an 8-bit Atari emulator for Windows 95.

telnet://cth.tzo.com/

Sysop: Tom Hunt, mailto:tomhunt@bright.net

Subject: 6.1) What is FidoNet?

[We're not quite sure of the source of the following two paragraphs, but they may have been orginally written by Alan Sharkis.]

FidoNet is a system not unlike the Internet in that it consists of BBSs linked together. Each discussion group (there are nearly a thousand) may or may not be carried by an individual BBS as the sysop chooses. Discussion groups are called echoes, and each echo must be moderated. There is an Atari National Echo which is 8-bit, and several (I believe) ST echoes. BBSs are also free to have local discussion groups that may or may not be echoed nationally.

To access FidoNet, you need to find a FidoNet BBS that carries the echo or echoes you wish to read, and then abide by the rules of both that BBS and the echo. Some of these BBSs require annual membership fees. Some are supported by voluntary donations. One such that can also be reached by telnet is Doc's Place BBS. I'm not even sure of its location, but I think it's Clearwater, FL. If you're coming in via an ordinary ISP and either Netscape or IE, you simply type:

telnet://bbs.docsplace.org

mailto:krap@zwieracz.ideefixe.nom.pl (maciej grzeszczuk) adds:

all fidonet backbone echoes are carried by zwieracz.ideefixe.nom.pl, and they are available read-only via any newsreader. zwieracz itself (2:480/70, 2:48/70, 2:48/700, 2:2/3009) is the main polish fidonet-internet gateway. i gateway many usenet groups onto fidonet echoamil bidirectionally, so fidonet users here in poland can easily read and post articles. this group is also available at my system via EMSI over TCP or standard modem dial-up connection (emsi over tcp ports are 60177 - for telnet, and 60179 for raw socket).

try url: news://zwieracz.ideefixe.nom.pl/fido.atari and you'll reach national ATARI group.

Subject: 7.1) What is the Atari 8-bit Computer Web Ring?

A WebRing is a set of web pages that have been linked to each other. Basically the first page in the ring has a link to the second one, the second one to the third, the third to the fourth... with the last page linking back to the first. This is all done by adding a small piece of HTML code to your page, which will automatically keep track of where your page lies in the WebRing. In this way pages from all over the world dealing with similar subjects can be linked together. In our case the subject is Atari 8-bit computers, so all pages in this WebRing are about the Atari 8-bit.

The home page of the Atari 8-bit Computer Web Ring is at:

http://www.geocities.com/SiliconValley/Lakes/7953/a8ring.html

and the ring is maintained by Raphael Espino, mailto:rje@co.umist.ac.uk

---

Subject: 7.2) What WWW pages support the 8-bit Atari?

This should be a complete list of WWW pages supporting the 8-bit Atari.

Subject: 8.1) What IRC channels discuss the 8-bit Atari?

==> #atari8 - Just for 8-bit Atari users!

Paul Clark offers this tip:

I think Dalnet carries #atari8, do the following;

telnet://telnet.dal.net

At the login prompt, type;

dalnet

If prompted for a password, just hit enter. You should
be able to navigate to #atari8 from there.......

==> #rgvc - Classic Games and Systems Collectors. "Rec.Games.Video.Classic"

mailto:cmwagner@gate.net (Chad Wagner) writes:

If you have access to a Unix host then you should be able to get to irc by
typing irc at your shell prompt and jumping on an EFnet server
(irc.portal.com, irc.eskimo.com, dewey.cc.utexas.edu) and joining #atari8.

If you are using a host that has a menu system then locate IRC and go there,
and join #atari8 (and hope your on EFnet, :).

Another that carries #atari8 is ssilicon.w1zard.net run by Jon Melbo.

If you are using SLIP/PPP then download a client (for Windows users, download
mIRC for Winsock archives, and I would guess that most SLIP/PPP users -- if
they have gotten that far -- are familiar with IRC, :) and select one of
the servers and join #atari8. There is many IRC servers on EFnet, chances
are the one your on is on EFnet.

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
filenames: Archivers/uudecode.bas, Archivers/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
filename: Archivers/yau.arc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
filename: Utilities/uue.arc

Dumas UU-coder by John Dunning
filename: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The archives contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
filenames: Archivers/superarc.arc - both Super Un-Arc & Super Arc

Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc

Subject: 9.3) What are the .DCM, .ATR, and .XFD file formats?

These are all filename extensions used to name files containing entire 8-bit
Atari floppy disk images.

DCM - Disk Communicator format. Invented by Bob Puff,
mailto:audioguy@cheerful.com for his Disk Communicator 3.2 utility.
Used when working with native Atari hardware.
DCM specs at: http://home.planet.nl/~ernest/diskcomm.zip

ATR - Atari disk image format. Invented by Nick Kennedy,
mailto:nkennedy@cswnet.com for his SIO2PC project.
Used when working with non-Atari hardware.

XFD - Xformer disk image format. Invented by Emulators Inc,
mailto:emulators@msn.com for their ST Xformer emulator.
Identical to ATR except without the 16 byte header.
Used when working with non-Atari hardware.

PRO - APE ProSystem format. Invented by Steven Tucker,
mailto:classics@nacs.net for his APE ProSystem device.
Used with APE, the Atari Peripheral Emulator.

Subject: 9.4) What are the .XMO and .BIN file formats?

XMO stands for XMODEM. The idea was that the file was not plain text,
but was a binary file. As a binary file, it had to be downloaded using a
file transfer protocol such as XMODEM. The use of ".xmo" as a filename
extender was popular once, but has been discouraged for years.

BIN - another filename extension sometimes used to designate binary-load
files. Like .xmo, use of .bin is discouraged.

Subject: 9.5) How can I make my commercial boot disk (tape, cart) into a load
file or disk image?

Russ Gilbert, mailto:russg@en.com writes:

The disk image part is a matter of taking a copyable boot
disk and making an atr, xfd, dcm or other disk image type
file out of it, usually for use with an emulator. Before
emulators, the Bob Puff .dcm format was used to
store/archive/retrieve boot disk images.

Almost all commercial software for the A8 is/was copy protected. For boot disks, this usually involved a large number of special formatting that couldn't be copied using ordinary sector copiers. Usually the boot process involved checking to see if a certain sector error occurred, then proceeding. If the error did not occur, the disk was a copy and would not work.

For carts, usually the method of protection was to write to the cart area of memory and see if the value changed. If the value changed, the cart program was in RAM, not ROM and would fail to operate.

For tapes, again a fair number of schemes were used. Some varied the speed at which the tape loaded. I'm not familiar with tape protection schemes.

With all software media (cart, tape, disk), there may be program encryption, which must be decrypted before the program can run. This to make more difficult disassembly of the program.

There were/are a number of products to defeat copy protection/allow copying of protected software for the A8. The most common way to defeat copy protection was to disassemble the software and revise sections of code so that the copy protection was defeated. A software with defeated copy protection is called a 'cracked' software. The basic procedure is to understand how cart/tape/disk software initializes, loads and runs. Usually make a file out of the software and 'follow the code', starting with loading of the program, to decryption to the actual running of the program. Today, it is unnecessary to copy original commercial A8 software because it has already been defeated and may be found at a few ftp sites. (Note umich archive has no commercial/non-shareware software.)

Besides 'cracking' software, there were/are hardware devices to copy commercial protected software. The Happy 1050 and the Archiver, and probably other modifications to the 810, or 1050 allowed 'bit image' copying and reproduction of the special formatting that copy protected disks had. Using these archiving disk drives, a copy of the original disk, including all special formatting and the original code is copied, thus making a copy protected copy, not cracked, just like the original.

For carts, copying could involve cracking or again there were/are products to reproduce the cart and simulate a ROM. Or the cart might be copied and burned on the correct type of eprom, to make a plug in cart. 'The Impersonator', the 'Pill' are two cart copy schemes copy the cart to a file, then don't change the code, but use a 'dummy cart' to fool

the software into thinking there is a ROM present.

Basic tools for copying, then cracking, carts and disks are
a sector editor and disassembler. Carts are usually most
easily dumped using a special OS, like Omnimon, to interrupt
the cart and dump memory to disk. There are a few pd cart
copiers that have the user plug the cart in when the program
is running, I don't believe these pd cart copiers are very
good or very wise to use.

So, the basic answer to 'how do I make a copy of my copy
protected commercial software' is don't bother. Find it on
the net.

There is one exception, in that this 'solution' involves a
minimum of effort and is relatively safe. I refer to
'Chipmunk' and 'Black Patch' software to make cracked boot
disk copy of commercial disks. HOWEVER, even if you use
these two commercial archival tools, be sure you write
protect your originals, and be careful not to accidentally
write to the original disk.

Finally, I'll mention a very modern (I mean 1997) product.
The APE Pro system, by Steven Tucker, in the registered
version of this shareware allows making disk images called
'Pro' images. APE (Atari Peripheral Emulator) requires a
cable, called the SIO2PC cable, that connects the A8 13 pin
serial port to a serial port on the IBM PC clone. To make
'Pro' images, a special adapter cable is needed, not just
the 'standard' SIO2PC cable. The 'Pro' image can 'capture'
the copy protection of an original commercial disk. The
'Pro' image can then be loaded into an A8 using the APE
registered version software, thus backing up your original
disk software. Note the 'Pro' image will only be of use to
person(s) owning registered APE software and 'Pro' adapter
cable.

Subject: 9.6) How can I convert my commercial boot tape into a cassette
image file?

mailto:ernest@wxs.nl (Ernest R. Schreurs) writes:

For those of you that like ALL classic Atari software, there is now a
way to store all software that has been recorded on cassette tapes on
the hard disk of your PC. I have written a program that is similar to
the SIO2PC utility written by Nick Kennedy. But this one is intended
for use with cassette software. You will need the following items:

Any PC equipped with a sound card and about 50 to 100 Megs of free
disk space to work with. The sound card should be able to sample sound
at a sample rate of 44.100 Hz mono. The sample must be recorded into

a .wav file.
You need the wav2cas program to convert the .wav file to a .cas file.
The .cas file is a digital cassette image file that only contains the
data that is on the cassette tape. Once you have that, you can throw
away the .wav file. The .cas files are typically 16 to 64K, so they
are relatively small.

To load cassette files into your Atari (i.e. boot a digital cassette
image) you do not need a sound card. You do need a SIO2PC cable or
similar device. You also need the cas2sio program.

The wav2cas and cas2sio programs should be available from the archives
of Umich by now. They have been put together in one zip file
wav2cas.zip, along with the documentation and the 'C' source code.
You can download it through the web interface at the URL
http://www.umich.edu/~archive/atari/8bit/Emulators/Peripherals/wav2cas.zip
Note the capital in Emulators and in Peripherals.
Thanks to William Kendrick for helping me get it uploaded there!
You can also try the gopher stuff:
gopher://gopher.archive.umich.edu:7055/11/atari/8bit/Emulators/Peripherals/

Steven Tucker, the author of APE, has added support for this file
format as of version 1.15 of APE. It looks real neat, so try that out
too! Thanks to Steven for adding a nice user interface for these
cassette images. He did a nice job. I am hoping other using are
willing to write some programs to get more enjoyment out of this
underrated storage medium.

My stuff is available totally free for personal use, so I hope you
enjoy it. Read the docs about the conditions.

Keep those XL's/XE's humming.
If you have any questions feel free to E-mail me: mailto:ernest@wxs.nl

---

Subject: 10.1) What kinds of monitors can I use with my Atari?

In general, you either need a Composite Video monitor, or a standard TV.

Television:
You'll need a video cable (not detachable on the 400/800), and a TV Switch
Box. Used with VHF Channel 2 or 3.

Monitor:
The 8-bit Atari produces a color Composite Video signal, plus
separate chroma (color) and luminance (brightness) signals which the best
composite video monitors can take advantage of. Popular examples of such
monitors include the family of monitors produced by Commodore.

Gotcha's:

-the 400 and North American 600XL lack a monitor port entirely. They can only
be used with a TV.

-the XE Game System provides an RCA-style jack in place of the Monitor port; so it provides Composite Video but lacks separate chroma\luma signals

-the 600XL, 800XL and 1200XL lack separate chroma signal (can be added via hardware modification)

-the XEP80 Interface Module produces a monochrome Composite Video signal via an RCA-style jack. This higher-resolution signal produces crisp, clear 80 column text on 80-column monochrome composite video monitors.

The pinout of the Monitor port is in the pinout section of this FAQ list. The monitor connector on the back of the Atari can be utilized using a 4-pin DIN to RCA converter. You don't need to build a separate cable.

mailto:buesch@srv.net (Brent Buescher, Jr.) writes:

"The best monitor for an Atari 8 bit that is readily available today would be a television with an S-video input---these tend to be large and high-quality, so the s-video input is the deciding factor there. You'll have to build the cable yourself, and if you have an XL you'll want to do the Super Video upgrade that Ben Poehland published in Atari Classics a few years ago---this puts the chroma signal back on the pin that it should be and cleans up the video signal enormously. It's really more of a fix than an upgrade.

I use a commodore split-video monitor. They work great and are cheap-to-reasonable when you can find them."

mailto:bryede@emi.net (Bryan Edewaard) writes:

"Yes, the best choices are monitors that support "Separated Video" (sometimes called Commodore video on Commodore monitors), or S-Video. These monitors have separate color and luminance video inputs, which give a sharper picture without cross-color artifacts - such as the colored fringes on text when viewed on a TV (although some games use these artifacts to get additional colors). If you have an XL computer, then it needs an upgrade to support these monitors due to the omission of chroma from the monitor port. the 800 and XE computers don't have this problem.

The 2nd best choice is a TV or monitor that has a "Composite Video" (usually called just "Video" or "Aux") input. This is a signal that has the color and luminance information combined into one signal. The picture will be a little less sharp, but still much better than using the "Channel 3" output.

>Where might I find one?

I've seen them a flea markets, garage sales, swap meets, ham fests, and in newsgroups like this one. Plus, many new TV's support S-Video and Composite video inputs.

>What are the advantages of using one of these rather than a TV?

Well, it's all a matter of how many stages the signal must go through.

1. The Atari generates video as a color signal and a brightness (luminance) signal. These are passed to the monitor port as Chroma and Luma signals (XL's have no Chroma output from the factory).

2. The signals are mixed together to make a standard video signal which is also passed to the monitor port as Composite Video.

3. Then the mixed video signal (along with audio) goes through the process of being "modulated" into a TV radio signal (channel 3 or 4). This step involves removing high frequencies from the video (blurring it) and sending it to the TV in a fragile broadcast form that's suseptable to all kinds of interference. Then the TV must (1) extract the video signal from the radio signal, (2) separate the Chroma and Luma components as best it can, then (3) divide the Chroma in R, G, and B. Any of these steps that you can eliminate will help your picture.

>Are there any other composite video monitors that anyone would recommend
>(and where might I find one)?

Maybe the 8-bit FAQ mentions these monitors. The most common one is probably the Commodore 1702 which has a very good picture and is quite reliable.

If you plan to use an XL (which I do), upgrading the video circuitry makes as big a difference as what monitor you choose. Ben Poehland has some excellent articles in Atari Classics magazines for improving the quality of the XL's video, as well as restoring the missing Chroma output."

Lonnie McClure mailto:lmcclure@ibm.net has the last word on Commodore monitors:

Comodore models: 1701, 1702, 1802, CM-141, 1080, 2002, 1902, 1902A*, 1084**, 1084S**.

* The 1902A used a DIN connector for chroma/luma, which makes cabling a bit more of a problem. The composite and audio connectors are standard RCA jacks, however.

** The 1084 and 1084S had more than one version. Some used the a DIN connector for chroma/luma connections, like the 1902A, while some used standard RCA jacks.

The 1902 and 1902A are very different in appearance. The original 1902 shares the same slightly rounded front case design as the 1080 and 2002, while the 1902A is has a rather square case design, and was manufactured by Magnavox (as were some of the 1084 and 1084S versions).

Jerry Jessop, mailto:jjessop1@home.com explains why French Ataris produce fewer colors:

"I will tell you why it only has monochrome out, because it's SECAM and a SECAM GTIA was never produced. The PAL GTIA is used in France and the Lum outputs are run into an onboard encoder to produce a "psudo" color depending on the Luminance output, composite only. This is why a SECAM VCS or 800 has

nowhere near the same number of colors (16) availible as a PAL or NTSC unit (256).

The FGTIA was never completed as the market size did not warrant the expense. The largest SECAM market is not France but the Soviet Union (former) and in 80-84 sales of these items there were not possible."

Subject: 10.2) What is the difference between NTSC and PAL machines?

Software written for NTSC (North America) will always work on PAL machines, but software designed on PAL machines (Europe) won't necessarily work on NTSC machines.

Wayne Booth, mailto:trek@ihgp15.ih.att.com writes:

The differences with PAL and NTSC have to do with the number of lines displayed on the screen and whether they are using 50 or 60 Hertz.

If I remember correctly, I believe PAL has 625 lines/screen and they refresh the screen 50 times a second doing 1/2 the lines each refresh so they effectively repaint the screen 25 times a second. NTSC is 525 lines/screen with a 60 times a second refresh - again only half the lines each refresh so a 30 times a second frame rate. This would change the amount of time available during vertical sync pulse, and the number of lines that need to be redrawn each time.

Graham Thornton, mailto:nero@chicagonet.net adds:

I use both a real PAL Atari 800 and a PAL-ANTIC 1200XL here in the US.

Replacing the ANTIC chip with a PAL version changes the screen refresh rate to 50Hz which allows most of the PAL-only European software to run. Your system will still report itself as a NTSC machine, unless you change the ROM (see the Nir Dary upgrade), but most software doesn't care.

The one problem you might run into is your monitor. Replacing the ANTIC will mean your North-American Atari is now generating an NTSC signal at 50Hz, instead of the usual 60Hz. Some people will tell you that modern TVs and monitors don't care but that isn't actually true. My brand-new Sony Trinitron 15" colour TV/monitor goes bezerk with the upgraded 1200XL, but my 15-year old 10" Texas Instruments color monitor (designed for the TI-99/4A) is fine.

You can also use real European equipment here in North America, provided that you have a PAL-compatible TV/monitor. The frequency of the power system is irrelevant, as I use my 800 with a 110V/60Hz 1050 power supply.

Subject: 10.3) Is the software for the Atari 8-bit computers "TV-standard dependent?"

{some PAL demos flicker, or won't run at all on NTSC machines}

mailto:buesch@srv.net (Brent Buescher, Jr.) writes:

This is because PAL machines have a vertical refresh frequency of 50hz
(NTSC use 60hz) which translates into more vertical blanking time for
demos and other computation-intensive graphics software. So PAL demos
that won't work on NTSC machines are usually returning from a VBI
(vertical blanking interrupt) too late. Some also attempt to use more
vertical resolution ("longer" display lists) than an NTSC display can
handle.

mailto:thor@math.tu-berlin.de (Thomas Richter) adds:

Yes, it is. Mostly because the frequency of the vertical blank interrupt
is different (60Hz for NTSC, 50Hz for PAL). The old OS A was not clever enough
to notice the difference, so all system timings like the keyboard auto-repeat
function depend on the TV system. These parts of the OS have been corrected
with OSB and the XL versions of the OS. However, as most games install a
VBI, their timing does still depend on the frequency -> they will run
slightly slower for PAL versions.

Another point is that the popular pseudo-colors used in the Antic-F
(Graphics 8) mode are not colorful at all when displayed on a PAL TV, because
of differences in the color encoding for the TV. The schematics of
the Xl computers include however a hack how to change the PAL version to
the NTSC version (the PAL versions include two crystals, one with 5/4th of
the frequency of the other. One is used for the system clock, the other for
the color clock), but I never dared to apply it.

Subject: 10.4) What are the PAL, NTSC and SECAM video broadcast standards?

Here are several links on the topic.

Subject: 11.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal
programs available.

Ice-T XE v2.72 (128K XL/XE) or Ice-T 800 v1.1 (48K)
shareware by Itay Chamiel, mailto:itayc@hotmail.com
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: X/Y/ZMODEM download
Autodial: Yes (2.72) or No (1.1)
Backscroll buffer: Yes--8 screens (2.72) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.72) or No (1.1)

Summary: Outstanding flicker-free high-speed VT100 emulation.Recommended!
http://www.cs.huji.ac.il/~itayc

FlickerTerm 80 v.0.51, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus

BobTerm 1.22, shareware by Bob Puff
(There's also a 1.23 that's specific to PC XFormer)
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; best for BBSing
filename: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
filenames: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Only option combining VT100, XMODEM, Kermit; buggy at file Xfers
filename: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes

Summary: Only option for VT100 emulation on the XEP80; 1200bps top speed
filename: Telecomm/vt850b1.arc

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
filename: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
filename: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
filename: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett with Mark Vallevand, and
SpartaDOS disk utility by Mark Vallevand
filename: Diskutils/myutil.zip
includes best version of UTIL for read/write of SS/DD 180K Atari disks,
plus Mark's SpartaDOS disk utility v0.1e to access 180K SpartaDOS disks

MyUTIL and the XF551 - tips from mailto:JTKIRK@urp.edu.pe:

]MyUtil works fine with the XF551. The XF551's speed is 300 rpm (sometimes even
]up to 303 rpm). I've got two XF551s and can read/write disks written on a PC
]with MyUtil on both with no problems. MyUtil even can write to a DS/DD disk,
]for a total of 360 K, BUT: the ATARI disks not only have the bits inverted,
]the second side is also read BACKWARDS respect to PC disks. That is, when
]MyUtil on the PC writes to what it thinks is sector 721, it really is writing
]to sector 1440! Worse, if you take an ATARI disk with a file whose sectors
]get past sector 720, MyUtil will attempt to read the sector 2161-n instead of
]'n', and you'll get a 'truncated record' error. The solution is simply to
]rewrite the code to take into account this (if sec>720 then sec=2161-sec).
]Let me know if you modify this. You don't know how frustrating it is to have
]to use only 180 K of a 360 K disk! I'm going to analyze the source code, but
]I don't know if I will be able to modify it properly. If someone does it
]before, please email me and send me an uuencoded copy or tell me where to get
]it.

Here's some advice on using the above utilities from mailto:hans@umd5.umd.edu
(Hans Breitenlohner):

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (288 rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,

making that sector unreadable. (The next physical sector is usually
the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)
Konrad Kokoszkiewicz, mailto:draco@mi.com.pl answers:
"The XF551 disk drive is not slowed down - these drives are spinning
300 rotations per minute. To prevent troubles with read/write disks
formatted and written on normal Atari drives (288 rot/min), the main
crystal frequency for the floppy disk controller is 8.333 MHz
(not 8 MHz, as in 1050, for example)."

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width. The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on
either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC
for PC to Atari transfers.

Jon D. Melbo, mailto:ssilicon@lax.net sums it up this way:
So a basic rule of themb when sharing 360KB floppies among 360KB &
1.2MB drives is: Never do any writes with a 1.2MB drive to a disk that
has been previously written to in a 360KB drive....UNLESS... you only
plan on ever using that disk in the 1.2Mb drive from then on out. Of
course a disk can be reformated in a particular drive any time for use
in that drive. As long as you follow that rule, you can utilize the
backwards compatible 360KB modes that most 1.2MB drives offer.

While the above work with SS/DD 180K Atari-format disks, the following
combination of utilities can be used to work with SS/SD 90K Atari-format
disks, and is currently the best bet for reading SS/ED 128K Atari-format
disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
filenames: Xf2/anad207.zip, Xf2/anadisk.txt
Apparently 2.07 is buggy.
Anadisk 2.06 is available at: http://ch.twi.tudelft.nl/~sidney/atari/

Deana by Nate Monson - converts AnaDisk dump files from Atari format
filenames: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to mailto:crow@cs.dartmouth.edu (Preston Crow),
"As best as I can figure it out, if your PC drive happens to read

FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 11.3) Can I read/write MS-DOS disks on an 8-bit Atari?

a) Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050
drive or equivalent. Very limited.
filenames: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

b) SIO2PC, described elsewhere in this FAQ List (section 11.5), can be
used to read/write to a hard drive connected to an MS-DOS system. This
can also be a very effective file-transfer solution.

c) The XF551 3.5" Upgrades from Computer Software Services (see the
companion vendor/developer list) allow the Atari XF551 disk drive to read
720K 3.5" MS-DOS disks.

d) The Floppy Board, the add-on to the Black-Box from Computer Software
Services (see the companion vendor/developer list), allows both low
density (360K 5.25", 720K 3.5"), and, in the case of the Deluxe
Version, high density (1.2M 5.25", 1.44M 3.5") external MS-DOS-standard
floppy drives to be used on the Atari. A utility is included to
read/write MS-DOS formatted floppies in all supported densities.

Subject: 11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (Russ Gilbert)

Q: How do I connect two cmputers using a null modem cable?

A: You need a term program and RS 232 ports on both
computers. The RS 232 ports need to be connected
together using a 'null modem cable'.

For up to 4800 baud, no flow control lines need be
connected. Just cross the transmit and receive lines
and join the grounds together. Transmit is pin #2,
receive is pin #3 and ground is pin #7 on the 25 pin
port. 25 pin #2 goes to Atari #4 (XMT to RCV), 25 pin
#3 goes to #3 on Atari (RCV to XMT) and #5 of 850 goes
to #7 of 25 pin (GND to GND).

The right hand pin on the 'long' side of a female 'D'
connector is #1. There are 13 holes on this 'long'
side, 12 holes on the 'short' side. The numbers go

to the left 1 to 13 then #14 is under #1 and left again so that #25 is under #13.

Most term programs allow a null connection, without a carrier detect. Notably, 'Express 850' does not. I have only used 'Procomm 2.4.3' (the last shareware version of Procomm) on the PC and Bob Term on the Atari, but other term programs may work.

To check your null modem connection, start both PC and Atari term programs, set baud to 2400 or 4800 on both computers. No parity, 8 data bits, 1 stop bit on the PC. Be sure to use the correct COM port on the PC. Go to 'terminal' mode and you should now be able to type on either computer and see it on the other screen. To accomplish a file transfer, use Y-modem probably from Bob Term, rather than X-modem. X-modem will often append bytes to a file transfer, an undesirable event. There is also a very nice Z-modem recieve program for the Atari, called AtarZmodem by Larry Black for the Atari.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors (Radio Shack) some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modems and plugging in the null modem cable into the two modem cables. This also avoids the confusion of variations in the computer ports. Most computers connect into the modem end via a standard RS232 DB25 connection. With this both ends 25 pin cable, you would cross pins 2 and 3 and connect the #7s together to make a null modem cable.

The SIO port on the Atari cannot be used directly. An 850, P:R: connection, MIO, Black Box or similar device that provides an RS232 port must be used.

Following are pin assignments for a DB25 pin RS 232 C port.
1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

For higher speed connections, above 4800 or 9600, you need the flow control lines and Atari term software that has flow control built in. You also need an MIO or Black Box, which uses the PBI (parallel bus). A high speed

cable would need not only XMT, RCV, and GND, but also
flow control lines. I suggest a commercial null modem
from computer store to ensure correct lines. A null
modem is a small adapter with the correct lines already
crossed. I don't know how to correctly connect the CTS,
RTS, DTR, DSR, CRX lines for a high speed null modem.
With a null modem, you just plug it into the 25 pin
connectors of the two modem cables you might already
have connected to your Atari and PC or Mac. You may need
a straight thru 25 pin gender changer also.

Following is in this FAQ elsewhere, but I summarize here:
(Figure out or look for pin numbers on the ports.) Note
that these are pin assignments, and NOT null modem
connections with the XMT, RCV crossed and GND straight
thru.

Atari 8-bit PC AT 25 PC AT 9 pin
----
1. DTR 20 4*
2. CRX 8 1*
3. XMT 2 3
4. RCV 3 2*
5. GND 7 5
6. DSR 6 6
7. RTS 4 7
8. CTS 5 8
9. No connect? shield RI
22 RI

Note: * above indicates the difference between an AT 9 pin
and a Atari 8-bit 9 pin cable connector. eg. If you check
continuity from pin 3 of 25 pin end and it goes to pin
4 of nine pin end, you have an Atari serial cable. If pin
3 of 25 pin goes to pin 2 of 9 pin end, you have a PC
serial cable.
(updated 3/1/99)
(DTE = Data Terminal Equipment ie. your computer.
DCE = Data Communications Equipment ie. your modem.)

Subject: 11.5) What is SIO2PC?

From the SIO2PC home page, written by Nick Kennedy:

SIO2PC is a hardware & software package interfacing the 8-bit Atari to PC
compatible computers.

The original idea was to have the PC emulate Atari disk drives so Atari
programs could be stored on the PC's hard (or floppy) drives. It turned out to
be quite successful. About 95% of my work was in the software, but a hardware
device to convert logic levels was also necessary. This device is now commonly

referred to as an SIO2PC cable.

Features:

Emulates 1 to 4 Atari disk drives

Store your Atari files on PC hard or floppy drives

Boot from the PC, real drive not needed to start-up

No software or drivers required for the Atari;
no conflicts: use your favorite DOS

Twice as fast as an Atari 810 drive and more reliable

Co-exists with real drives in the Atari daisy chain

Compatible down to the hardware level: use sector copiers, etc.

Print-Thru captures Atari print-out and routes to PC's printer

Convert Atari files to PC files and vice versa

1050-2-PC version connects PC directly to Atari disk drive

Nick Kennedy
mailto:nkennedy@cswnet.com
http://www.cswnet.com/~nkennedy/

Another source for building SIO2PC cables is Clarence Dyson's page at
http://www.redshift.com/~cdyson/atari.html

Subject: 12.1) What 5.25" floppy disk drives are available?

Major contributors to this section:
mailto:Krishna@max.tiac.net (Glenn M. Saunders)
mailto:tatar@comarch.pl (Tomasz M. Tatar)
mailto:sup8pdct@mail.cth.com.au (James Bradford)
mailto:draco@mi.com.pl (Konrad M. Kokoszkiewicz)
mailto:dons@QNET.COM (Don Schoengarth)
mailto:magea000@mail.uni-mainz.de, Andreas Magenheimer

Random definition from Steve Tucker:
'Atari Double Density' is 256 byte sectors stored in MFM.

mailto:magea000@mail.uni-mainz.de, Andreas Magenheimer writes:
You can classify those many floppy drive enhancements (speeders)
into two categories: a) using Track/Cache buffer (Happy, Speedy, Clones,
etc.), b) using Sector Skewing (USD, Turbo, XF551, Hyper-XF, etc.). I do
not know those third party drives, like Percom, Rana, Indus, Trak, etc.,
but I am sure they will fit into one of these two categories... -

==> Atari 810
SS SD 19.2Kbps standard

==> Happy 810
SS SD Warp speed 52k

==> 810 Turbo upgrade for the 810
SS SD/DD by Neanderthal Computer Things (NCT) (Irvine, CA)

==> Micro MainFrame MF1681 came with DOS 2.0S, OS/A+, and Maxi-DOS A
SS SD/DD supports up to 7 slave drives

==> Atari 1050
SS SD/ED 19.2Kbps standard
Black & white left: Drive 1
Black right, white left: Drive 2
Black left, white right: Drive 3
Black & white right: Drive 4

==> 1050 US Doubler Created by ICD, now sold by K-Products
SS SD/ED/DD UltraSpeed 52k. uses sector skewing

==> Happy 1050
SS SD/ED/DD Warp speed 52k ; track buffering

==> Cheer-Up 1050
Clone of "Happy" 1050
SS SD/ED/DD

==> Super Archiver 1050
SS SD/ED/DD UltraSpeed 50+K

==> Speedy 1050
SS SD/ED/DD 55-57k bps

==> Super Speedy 1050
SS SD/ED/DD Like the Speedy 1050, but enough RAM on board to
hold the contents of an entire disk

More about Speedy from Andreas Magenheimer,mailto:magea000@mail.uni-mainz.de:
Speedy or Big Speedy means: old Speedy version, big size, big
price, avaiable (or ability to update) with Track LCD. Used a big plate
and older chips/older layout. There were different versions of Speedy,
like Speedy D (with DOS on ROM chip), Speedy S (with sectorcopier on ROM
chip), Speedy DS (DOS and Sectorcopier on ROM chip) and finally Speedy T
(Track LCD). The price for these big Speedy enhancements was very
high...

A Mini Speedy simply was the newer Speedy version. It has merely half
the size of a big speedy, thus newer chips and a newer layout. It has
DOS and a Sectorcopier in a ROM chip. It could not upgrade with a Track
LCD, therefore it was much cheaper !! The DOS mentioned was Bibo-DOS,
the Sectorcopier was Sector-Copy 1.5.

Compared to a Happy, a Speedy as well uses a Track/Cache buffer for
Ultra Speed. Thus, a Speedy is nothing more than a European Happy
Enhancement clone. Many Happy software tools (DOS, Gamedos, Filecopier,
Sectorcopier, etc.) can be used on Speedy drives, but some special Happy

software cannot be used on Speedy drives and vice versa.

==> SuperMax 1050
SS SD/ED/DD 19.2k and 52k UltraSpeed
by Super Products. Compatiable with SuperDOS and K-Products US Doubler

==> Lazer 1050
SS SD/ED/DD Another Happy clone; Compatible w/ K-Products
US Doubler

==> Atari XF551
SS/DS SD/ED/DD 38400 burst mode usable only with SpartaDOS X,
SuperDOS 5.1, TurboDOS, DOS XE, and patched SpartaDOS 3.2. XF DS system now
considered "standard".

Both dips down: Drive 1
Left up, right down: Drive 2
Left down, Right up: Drive 3
Left and Right up: Drive 4

More data on the XF551 compiled by Marco Antonio Checa Funcke,
mailto:mcheca@li.urp.edu.pe :

Processor: 8040/8050AH at 8.3333MHz (docs say 18.33, but it's a mistake)
Disk controller: WD 1772 02-02 (I opened my drives and looked at the
complete code)
SIO data rate: normal: 19040bps (NTSC)/18866bps (PAL)
high speed: 38908bps(NTSC)/38553bps (PAL)
Rotaton rate: 300RPM
Power source: external power adapter, 9V AC, 31VA, 60Hz (NTSC)/50Hz (PAL)

Operating modes: Single Dual Double Density
Number of sides 1 1 2
Total tracks 40 40 80
Sectors per track 18 26 18
Bytes per sector 128 128 256
Total bytes 92160 133120 368640
Encoding method FM MFM MFM
Transfer rate 125000bps 250000bps 250000bps
Acces time: (maximum)
track to track 40ms 40ms 40ms
motor start 1000ms 1000ms 1000ms

And even more info, from Andreas Magenheimer:
There are two versions - one from Mitsumi and one from Chinon.
The Mitsumi Xf drive can read and write to a single/dual/double density
backside of a 5,25" disk (side b) if it is already formatted. The Chinon
drive cannot read nor write nor format the backside because it always
looks for the timing hole !! (If you insert a B-side of a disk without a
timing hole, it does not stop spinning around...even if this disk is
formatted) Therefore the Chinon drive has a flop-mechanism and a sort of
automatic-density detection (which is not supported by the OS !!). If
you put in a disk, the drive motor starts, trying to read that disk...

For better understanding: a Mitsumi drive may need a flop mechanism (so
a disk "flops" out, when opening the switch), a density detection (to
know the correct density - like a 1050 does !!) and a timing hole
redirection (thus not needing a timing hole). The Chinon drive would
merely need a timing hole redirection. Both drives then should have a
new OS that uses the capabilities to automatically detect the density...

==> CSS XF551
SS/DS SD/ED/DD K-Products US Doubler compatible. Updates drive to
work better and faster. Also 3.5" upgrade available

==> Percom RFD4x-Sy
where: x=0 -> a single-sided drive
x=4 -> a double-sided drive
y=1 -> a single-drive unit
y=2 -> a dual-drive unit

All Percom RFD drives support DD, and shipped with a DD controller.

==> Percom AT-88
SS SD

==> Percom AT88 S1 PD
SS SD/DD, plus built-in parallel printer port

==> Percom AT88 S2 PD, Same as the AT88 S1 PD, but dual drives

==> Trak ATD1
SS SD

==> Trak ATD2
SS SD/DD
Built in Diagnostics. Track indicator. Write protect switch. Built in
parallel printer interface. 2k printer buffer (expandable). Optional
Turbo software on Eprom.

==> Trak AT-1
SS SD/DD Slave

==> Indus GT
SS SD/ED/DD Synchromesh mode usable with SpartaDOS X and
DOS XL only. 72k under SpartaDOS X, 37k bps under DOS XL.

==> Astra Big-D
SS/DS SD/DD standard /LEDs and such

==> Rana 1000
SS SD/ED/DD standard /LEDs and such can format disks on a
stand alone basis

==> TOMS 720
double head disk drive, 5.25", with mounted interface Centronics,
chips: CPU 8085, WD2797, PIA 8255 (for handle Centronics), 32 KB ROM, 8 KB RAM
ROM contains: OS of drive, MYDOS 4.50 and some utilities (copy, format, etc.)
ROM is seen by computer as drive D1: (if drive is open), and D3: (when drive

has number D1:) or D4: (when drive has number D2:). It makes possible load DOS
from ROMdisk during booting system.
Formats of disks:
- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB
- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB
- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB
Transmition modes:
- normal - 19200 bps
- Turbo - 70000 bps
- UltraSpeed - 70000 bps
Also tracks buffering.

==> AS SN-360
double head disk drive, 5.25", CPU 8051, controler WD2797
19200 bps
Available formats:
- SS/SD - (FM) single sided, single density - 90 KB
- SS/ED - (MFM) single sided, enhanced density - 130 KB
- SS/DD - (MFM) single sided, double density - 180 KB
- DS/DD - (MFM) double sided, double density - 360 KB

==> TOMS 710
(The newest polish disk drive and probably the best one)
Similar to TOMS 720, one more format:
- double sided, 80 tracks, IBM (720 KB)
Transmition modes:
- standard 19200 bps
- TOMS Turbo (loaded from ROMdisk if drive is open) - 67000 bps
- UltraSpeed (QMEG-OS, SpartaDOS) - 67000 bps
Also tracks buffering.
ROMdisk contain:
- MYDOS 4.50
- COPY
- INIT
- TURBO - turn on/off TOMS Turbo mode
- BASIC - turn on/off Atari Basic
- AUTORUN.SYS - ramdisk
- README
Also TOMS Navigator instead of DUP.SYS. It is program similar to Norton
Commander on PCs.
IBM-ST copier on additional disk.

==> LDW Super 2000
SS SD/ED/DD 19200 bps or 67000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA2001 "California Access"
SS SD/ED/DD 19200 bps or 38400 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

3.5" system Unreleased

Subject: 12.3) What do I need to connect a hard drive to my 8-bit Atari?

original by mailto:Krishna@max.tiac.net (Glenn M. Saunders)

For starters, you'll need to obtain one of the following interfaces:

==> Corvus hard drive (10 megabytes)
Rare.

Fast but still relatively slow I/O, kludge through joystick ports for 800.

==> KPI Hard Disk Drive Interface (formerly Supra)
from K-Products (bobkla19@mail.tcd.net - Bob Klaas)
Some limitations on drive type and size and total number of drives in sys.

==> Multi I/O (MIO) (formerly from ICD)
from Fine Tooned Engineering (FTe) (ftooned@crl.com - Mike Hohman)
256 byter per sector restriction. 256K and 1 meg ramdisk models.
Printer and modem, modem will handle 19.2K bps

==> Black Box
from Computer Software Services (CSS) (mailto:audioguy@cheerful.com - Bob Puff)
Will handle all SCSI drives. Allows 9 drive access for MYDOS. Currently the
only modem interface with CTS/RTS hardware flow control. 19.2K ready.

==> SWP ATR-8000
Rare daughterboard for hard drives.
I/O is probably fairly slow on this baby and there may be DOS restrictions.

==> IDE Hard Drive Interface
from Konrad M. Kokoszkiewicz and Jacek Zuk
(see http://www.orient.uw.edu.pl/~conradus/docs/ide_eng.html)
o Maximum drive capacity: 16777215 physical blocks on each device.
o Maximum number of partitions: 16
o Maximum capacity of a partition: 16777215 logical sectors
o Logical sector length: 256 or 512 bytes
o Average speed (in kilobytes per second, WDC 130AB drive):
- Native mode, sequence of sectors (R): 75
- Emulation mode, sequence of sectors (R): 43
- Emulation mode, back sequence (R): 28
- Emulation mode, random sectors (R): 13

Subject: 12.4) What should I know about modems and the Atari?

Thanks to Bob Puff and Clay Halliwell for helping me with this section.
But I'm still not real confident about the accuracy here. I'd love for
anyone to help me fix up this section!

There are three types of modem protocols: modulation protocols, error
correction protocols, and compression protocols. The international
standards for these protocols are laid down by the branch of the United
Nations known as the ITU-TSS (formerly the CCITT). ITU standards are
known by their "V-Dot" names. They're only names, don't try to apply
any meaning to the names.

Modulation protocol standards, the major ones
(bits per second)
300 bps - V.21 (103J is used instead in the USA)
1200 bps - V.22 (212A is used instead in the USA)
2400 bps - V.22bis
9600 bps - V.32
14.4 Kbps - V.32bis
28.8 Kbps - V.34

Error Correction standard:
V.42 - requires either software or hardware flow control

Compression standard:
V.42bis - requires V.42, and hardware flow control.

If your modem is capable of V.42bis compression, set your communications
software to enable hardware flow control. If your terminal interface
allows you to set the terminal<->modem (DTE) and modem<->modem (DCE)
baud rates separately, you should set the DTE rate to the maximum
allowed. If the DTE and DCE cannot be set separately, set the terminal
baud rate at four times the maximum actual data rate of your modem
(V.42bis achieves a compression ratio of up to 4:1). Examples: If a
V.22bis/V.42bis modem is used, set the terminal for 9600 baud. If a
V.32/V.42bis modem is used, set the terminal for 38400 baud. If a
V.32bis/V.42bis modem is used, set the terminal for 57600 baud.

Let's define a "high-speed" modem as a modem capable of V.42bis compression.
(Some 2400 bps modems, and all modems faster than that)

Using high-speed modems on the Atari

Unless you're using a CSS Black Box or a patched MIO, the 8-bit Atari
RS232 interfaces do not support hardware flow control. (I have heard
that the P:R: Connection does too, but it can't be controlled in
software.) So we must send the modem a command to tell the modem not to
use it. Using a Hayes-compatible modem, the modem command AT &K4 will
enable software flow control, and disable hardware flow control. AT &K0
will disable all flow control.

The MIO patch, HyperSpeed by Len Spencer, is available at:
http://members.aol.com/lenspencer/atari8.htm

Question. Why does my modem report V.42bis is used even when my terminal it
set for the same speed as my modem?

Cause the modem will do what you tell it. You've configged it to talk at the
highest speed, using LAP/M, and compression. Even if you connect modem to
modem at 14.4k, you can be talking to the modem at 300 baud, and it will still
use everything. You'll undoubtedly drop bytes, but hey...

Question. Why does V.42bis compression appear to function after I have sent
the modem the AT &K4 or AT &K0 commands? And knowing the Atari doesn't
support hardware flow control?

Compression doesn't have to have flow control to work. Same as above - its
just an added step that the data goes through. Note that if the modem's input
buffer is small, you can overrun it easily if you send it data faster than it
can digest and send. That's why you -really should- be using flow control
with compression... But it's not a necessity.

Question. Why does V.42 error correction appear to work even when I have
disabled flow control with the AT &K0 command?

Question. Why don't I have problems performing binary downloads when I have
software flow control enabled? (flow control characters could appear in data
stream accidentally)

Depends on the protocol. Zmodem accounts for spurious XON/XOFFs. Xmodem and
Ymodem don't. Also, you are able to digest the data as fast as the modem is
giving it to you, hence no flow control is happening. I suspect it would be a
different case if you were uploading using a streaming protocol like Ymodem G.

More tips, from Clay Halliwell:
On 11 Feb 1996, mgfrank@acsu.buffalo.edu (Marc G. Frank) said:

> I'm having problems getting a modem attached to my Atari 850 to
> communicate at 9600 baud. When I set my communications program to 2400
> baud, everything works fine. However, when I set it to 9600 baud, the
> modem echoes my characters but doesn't act on them. That is, at 2400,

The problem with the 850 is that some of them (like mine) don't produce a PERFECT 9600 baud signal. As a result modems can't train on it, and while they will echo characters back, for some nitpicky reason they won't pick up on the "AT" attention code.

The solution is to do all your dialing at 2400 baud, but set the S37 register to force the modem to try to connect at 9600. Then switch your Atari to 9600 after connecting.

Jon Melbo responded to me in 1997:
On Fri, 21 Mar 1997 11:06:11 -0600, "Michael Current" <mcurrent@carleton.edu> wrote:

>I have a Zoom 2400bps V.42bis modem, connected through a P:R:Connection. I >need to do the
>at&k4 no matter what I'm dialing into, and no matter what comm program I'm >running.
>
>Nobody's ever really been able to explain it to me, but I know it has helped a >few other people. Try it!

What &K4 does is select XON/XOFF flow control. Apparently, all/most atari serial interfaces or at least R: handler software does not support hardware (CTS/RTS) handshaking (selected on the modem via &K3 which is also a default). Anyway, that's why the &K4 setting helps a lot.

Glenn Saunders responded to other writing of Jon's, 4/5/97:
: 28.8 CARRIER connects are possible BB or no, it's just that there is
: no point in having your modem do data faster than your puter can.

It simplifies modem configuration to let the modems connect at their native speeds.

: Right! But you should never have your DCE to DCE speed exceed your
: DTE to DCE speed. Never, unless you like errors and strange behavior.
: With a BB, one should use CTS/RTS flow control, and force the modem to
: operate at a maximum of 19.2 PERIOD (this means disable compression).

It doesn't really matter. CTS/RTS can throttle the I/O down as much as it needs to. The faster modem will wait for I/O without any complaints. Disabling compression isn't a good idea because it will disable it for ALL calls including 9600 or 14.4 users in which it could do some good even on an 8-bit BBS. Software flow control is pretty much dead in telecommunication, and has been dead as long as data compression has been standard since the stop and start commands take way too long to register that way.

: If using some other serial interface, I would use software flow
: control, disable data compression on the modem, force the modem to a
: max speed of 9600bps, and experiment with error correction. Does

This combination is deadly for most modern users unless they degrade their modem via reconfiguration. And if users have to do this, odds are they

will stay away rather than futz with AT settings to get a reliable
connect. That's why I think the MIO essentially died as a viable BBS
interface when 14.4s became standard. They won't work well unless the
"mythical" hardware flow control of the thing is enabled in some way.

An explanation of XON/XOFF from Eric Sokolowsky, 4/11/97:

I looked in my modem manual, and the at&k4 command enables XON/XOFF
flow control, which is a form of software flow control. As I understand
it, when a XOFF is sent by the receiving end of a line, the sending
end holds off sending for a little while to give the receiving end
a chance to catch up. When the receiving end catches up, it can
send a XON which tells the sending end to continue sending. Using this
should reduce the liklihood of dropped characters. It's not as good as
hardware (RTS/CTS -- check out the FC light on most high-speed external
modems on fast transfers) flow control (enabled by default or the
at&k3 command), but it's good enough for the Atari, which as I
understand, doesn't normally allow hardware flow control, unless using
such a device as the Black Box.

to which Robert Ely responded:

Just a quick addition. If you are using a modem at 9600bps or faster,
don't use xon/xoff, use the RTS/CTS. Since you can do this with the MI/O
and BlackBox, use it for all it's worth. If you are on an 850 or
P:R:Connection, you won't be able to deal with it and probably won't be
going at or above 9600bps anyway.

Subject: 13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari
users should treat themselves to either MYDOS or SpartaDOS to appreciate the
power of the system.

Either MYDOS or SpartaDOS will work with almost any disk drive, up to 8
drives or hard disk partitions, and ramdisk.

MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and
hard-drive support. MYDOS 4.53 is freeware from Wordmark Systems (Charles
Marslett and Bob Puff). There are two versions of MYDOS 4.53, one uses 3 digit
sector numbers where possible, known as 4.53/3; the other, known as 4.53/4,
uses 4 digits minimum. Complete documentation about the disk formats and
commands, as well as the source code, is available.

SpartaDOS is a completely different command-line DOS modelled after MS-DOS,
though it is perfectly capable of reading all Atari DOS and MYDOS disks.
SpartaDOS 3.2g and 3.2gx are disk-based; SpartaDOS X 4.22 is cartridge-based
and includes many additional features. SpartaDOS 3.3a and 3.3b were rewritten
by Stephen J. Carden for use with BBS Express PRO!. SpartaDOS 3.3c is
produced on a 16K ROM cartridge from Video 61.

It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
filenames: Os/dos25.arc (DOS 2.5)
Fte/fte32g.arc (SpartaDOS 3.2g)
Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Another popular, powerful DOS is BW-DOS, freeware by Jiri Bernasek.
BW-DOS 1.30 and all other versions are available via:
http://atari.boss.com.pl/files

Carolyn Hoglin, mailto:choglin@usa.net adds:
I didn't see TOP-DOS mentioned anywhere. This superior DOS was written by R. K. Bennett of Eclipse Software in Sunnyvale, CA. It was based on Atari DOS, but with many, many more features. It fully supports my double-density, double-sided Astra drives, automatically sensing the proper density and sidedness of both drives 1 and 2. (MYDOS only seemed to do that on drive 1.) Also supported are large ramdisks for Axlon, Mosaic, etc. The latest version was TOP-DOS 1.5+, which came with an excellent manual explaining how to use its powerful capabilities.

Any other versions of DOS all 8-bit Atari users should be aware of??

Subject: 13.2) What hardware has Atari created in the 8-bit computer line?

Computers:

Subject: 13.3) What are the power-supply requirements for my Atari
components?

Thanks to Matthias Belitz, mailto:matz@kawo2.rwth-aachen.de for the European
data in this section. I need more international help!

As with the rest of this FAQ list, please let me know if any of this
information conflicts with the units you have.

The most important information is the voltage (in volts) required, and
whether you need a transformer (AC output) or an adapter (DC output).
The power (in voltamps or watts) and current (in amperes) specifications
of the original equipment as presented here should be regarded as
minimum values. Higher-than-specified power and current capacities are
entirely usable, and often preferable because such supplies run cooler
and last longer.

Direct Current:
Power (in watts) = current (in amps) * voltage (in volts)

Alternating Current:
Apparent Power (in voltamps) = current (in amps) * voltage (in volts)
Effective/True Power (in watts) = current (in amps) * voltage (in volts)
* (cosine of the angle of lag)

Subject: 13.5) What BBS software can be used on the Atari?

This section mostly by mailto:winston@merk.com (Winston Smith)
Credit for AMIS to MACE by Steven Sturza, mailto:cordata@ameritech.net

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
The AMIS BBS was written in BASIC by people from the
Michigan Atari Computer Enthusiasts. It included designs for a ring-detector.
You needed a sector editor and had to allocate message space by hand, hex byte
by hex byte.

Steven Sturza adds:
The AMIS BBS was written by people from the Michigan Atari Computer
Enthusiasts.

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer, mailto:msinger@oe.fau.edu writes:
FoReM BBS derived from an early AMIS. When multiple message areas were
added the name was extended to FoReM 26M. Then, When OSS released BASIC
XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most
of the Assembler routines (where is he now?).

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported
features such as intra-line editors. Unfortunately, the coding of the
ABBCS was really poor. You could practically blow on your keyboard and
crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston,
Massachusetts, USA, area. I'm not sure whether his BBS for the
Atari 8-bit has been placed into the public domain or not. This BBS was
the first to support a RAMdisk, which Paul Swanson called a "V:" device
for "virtual disk". This BBS was written in Atari BASIC and required a
joystick hardware "dongle" device. This was notable as being one of the
first Atari 8-BIT BBSes that could actually go for a week without having
to be rebooted. Pointers to the message base were kept in an Atari "very
long string" (for which Atari BASIC is famous). The BBS would only have
problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of
the commercial BASIC XE cartridge to run. This BBS program was very
popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It
expects to be running under a SpartaDOS environment. This was a problem
until very recently, when the disk-based version of SpartaDOS was
re-released as shareware. This BBS program uses a "modem clock string"

rather than an R-Time 8 cartridge in order to retrieve the current time.
It also comes with an Atari BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BASIC XE
cartridge in order to run. It is in the public domain and can import and
export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only,
control ATASCII graphics are reserved for message data-structure bytes).
FOREM-XE BBS is still currently in use as we speak, and may be reached via
the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in
effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS,
which is the Keith Ledbetter companion project of the EXPRESS!-TERM
terminal program of days gone by. I am not familiar with this program. I
think that it is written in Action! and only supports XMODEM Checksum
transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE--
demo version of the OASIS BBS program. OASIS is very crash-resistant and
comes with a "dial out" screen so that the Sysop can use the BBS as a
terminal program to call and fetch files without having to bring the BBS
down and reload a terminal program. OASIS supports "Door programs" which
it refers to as "OASIS PAL modules". This OASIS demo module comes with an
excellent message system. The OASIS file system is one of the most
complicated that I have ever seen. It consists of "file libraries" with
suites of "file types". There is quite a bit of overhead involved in
performing a download (which may be a good thing, as it discourages file
hogs). There is a commercial version of OASIS called "OASIS IV" that
performs networking. There was an OASIS network between Boston,
Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word
of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank
Walters wrote it.

o Carina BBS -- a shareware product of Shadow Software.

o BBS Express! Professional -- a product of Video 61, www.atarisales.com

o OASIS IV -- a product of ???

o Forem-XE Pro -- by Len Spencer. http://members.aol.com/lenspencer/

Subject: 13.6) What versions of Atari BASIC or the CTIA/GTIA chip do I have?

Atari BASIC:

At the READY prompt, enter "? PEEK(43234)"

If the result is: You have Revision:
162 A
96 B
234 C

Freddy Offenga, mailto:F.Offenga@student.kun.nl adds:

there's another good answer (IMO):

You can also take a look at the part numbers on the IC's
inside your Atari and compare them with the numbers from
the following table:

Part# Version
~~~~~~~~~~~~~~~~~~~~ ~~~~~~~~
CO12402 + CO14502 A
CO60302A B
CO24947A C

CTIA or GTIA installed?

In BASIC, type POKE 623,64 [RETURN] and if the screen blackens, you have the
GTIA chip. If it stays blue, you have the old CTIA chip.

By the way, apparently no CTIA-equipped Ataris were shipped to Europe.

Clay Halliwell, mailto:earl.halliwell@dyess.af.mil provides this tidbit:

A bit of trivia: CTIA 400/800s artifacted in blue/green, GTIA 400/800s
artifacted in green/blue, and all XL/XEs artifact in red/blue.

Subject: 13.7) Which versions of the Operating System (OS) are there?

1 600XL 03/11/1983 0x643bcc98 CO62024
2 XL/XE 05/10/1983 0x1f9cd270 CO61598B
3 800XE 03/01/1985 0x29f133f7 C300717
4 XEGS 05/07/1987 0x1eaf4002 C101687

(?) This information is missing. If someone can supply this info,
please write me an e-mail.

NOTES:
The 400/800 O.S's consist of three ROMs (two 4kB and one 2kB).
The 1200XL contains two ROMs for the OS (8k each), XL/XE's use a single
16k ROM and the 16k XEGS OS is stored in a 32k ROM (together with 8k
BASIC and 8k for Missile Command).

Origins of ROM information
~~~~~~~~~~~~~~~~~~~~~~~~~~
400/800 rev.A NTSC Could exist, since the PAL version exists and
rev.A is mentioned in the rev.B source code.
400/800 rev.A PAL All info found in two Atari 400's and Atari 800
ROM module CX801.P
400/800 rev.B NTSC Information from a ROM dump and the rev.B source
listing. The part numbers were listed in the
catalog from 'Best Electronics'. According to
'Mapping the Atari' rev.B ROMs have a 'B' at the
end of the part number, therefore I figure these
part numbers are from rev.B.
400/800 rev.B PAL Could exist, since the NTSC version exists and
there's some conditional PAL/NTSC assembly in
the rev.B source code
1200XL rev.10 PAL/NTSC All info found in an Atari 1200XL. The XL/XE
rev.2 source code refers to it as rev.10.
'Best Electronics' calls it rev.A.
1200XL rev.11 PAL/NTSC Refered to rev.11 by the XL/XE source code.
'Best Electronics' calls it rev.B.
XL/XE rev.1 All info found in an Atari 600XL
XL/XE rev.2 All info found in an Atari 800XL
XL/XE rev.3 All info found in an 800XE
XL/XE rev.4 All info found in an Atari XE Game System

O.S. Authors and dates
~~~~~~~~~~~~~~~~~~~~~~
The following info is from the Atari XL/XE rev.2 source code.

Revision A (400/800)
D.Crane / A.Miller / L.Kaplan / R.Whitehead

Revision B (400/800)
Fix several problems.
M.Mahar / R.S.Scheiman
```

Revision 10 (1200XL)
Support 1200XL, add new features.
H.Stewart / L.Winner / R.S.Scheiman /
Y.M.Chen / M.W.Colburn 10/26/82

Revision 11 (1200XL)
Fix several problems.
R.S.Scheiman 12/23/82

Revision 1 (600XL/800XL)
Support PBI and on-board BASIC.
R.S.Scheiman / R.K.Nordin / Y.M.Chen 03/11/83

Revision 2 (600XL/800XL)
Fix several problems.
R.S.Scheiman 05/10/83
Bring closer to coding standard (object unchanged)
R.K.Nordin 11/01/83

Vapour-ware
~~~~~~~~~~~
The following OS roms originate from rare Atari 8-bit systems.
Since I don't own any of these (unfortunately), I don't have much
information about these roms. Who can help me?

I've got two 16K rom dumps from the 1450XLD. Both ID's are rev.3.
The first dated 3/23/1984 comes from the 'Pooldisk Too' CD-ROM
(filename: 1540os3.v0) and the second dated 6/21/1984 was send to
me by Nir Dary (filename: os1450.128). Main differences between
these two are in the first 3K ($C000 - $CBFF).

The XL/XE OS rev.3B is from an Atari from Arabia. It's probably based
on rev.3. There are changes in the fonts (Arab characters) and several
patches in the code. More info at:
http://www.savetz.com/vintagecomputers/arabic65xe/

Special thanks to Nir Dary for the rev.2 source code, rom dumps and
the 1200XL. It's in good hands.

Subject: 13.8) What games support 4 simultaneous players on the 400/800?

contributors to this section:
mailto:jlodoen@shell.portal.com (Jeff M Lodoen)
mailto:olavese@online.no (Vidar \"Hawk\" Olavesen)
mailto:pmulvey@erols.com (Pat Mulvey)
mailto:stevenposey@usa.net (Steven E. Posey) (Party Quiz controllers descr)

The following games support 4 player head-to-head play. Remember, only the
400 and 800 computer models sport 4 controller ports.

Asteroids, Basketball, Dandy, M.U.L.E., Maze War, Silicon Warrior, Survivor,
Thorn EMI Soccer, Major League Hockey

The following support 8 players on the 400/800 or 4 on the other computer
models, using the 2 controllers-per-port CX30 Paddle controllers:

Super Breakout, Worms?

The following supports 4 players on all machines, using special 4-button keypad
controllers linked together with RJ-11 jacks (standard phone jacks) to a box
with 2 joystick port connectors.

Party Quiz by Suncom

Subject: 13.9) Why should I disconnect the 810/1050 power supply before
connecting or disconnecting SIO cables?

Rich Mier writes:

You've been plugging and unplugging the SIO cable with the 1050 power pack
plugged in, right? That's a no-no. Most of the time it's Okay, but about 1
in 10, 20 times, it will blow out 'U-1'. It's a CA/LM 3086 I.C. at the right,
rear of the main board. A 14 pin DIL chip. Actually it is an array of 5
transistors.

Unplug the power pack from the 1050, then unplug the SIO cable. Power can be
ON on the CPU. The problem has to do with the secondary winding of the Power
Pack. Remember, the problem only occurs 1 out of 10 - 20 times that you do
it, not all the time.

It doesn't really matter if the 1050 Transformer has power on or off, it
'Might' happen if plugged into the 1050. It is really bad on 810's.

One thing, if the system has been turned off for, oh say, 5 - 10 minutes it
won't matter. By then all the capacitors should be bled(sc?) to 0 volts.

~~~~~~~

Subject: 13.13) What programming languages are available for the Atari?

This section also kept at http://www.student.kun.nl/f.offenga/lang13.txt

Revision : 1.3
Date.... : 4/19/1999

==
!!!! This section is under construction - HELP WANTED !!!!

The goal is to give information about all available languages
for the Atari 8-bit computer. This information will include:
title, last version, author, date and a short description.
It would also be nice to know how to get it and where to get
more information (like reference cards, reviews and such).

Freddy Offenga, mailto: F.Offenga@student.kun.nl
==

There are quite a lot! To get some structure in this section it's
divided into the following categories;

a) ASSEMBLER
b) BASIC
c) C
d) PASCAL
e) LISP
f) FORTH
g) PILOT
h) LOGO
i) All the rest

The following format is used:

- Language titel (medium)
version, year : version, year
author/company : author/company
available..... : where/how to get it
package....... : programs, documentation
features...... : main features
Description.

The question marks (?) indicate that more information is
required about that topic.

Definitions:
umich University of Michigan Atari archive

Some resources:
- The Multi-lingual Atari, Analog magazine 45, August 1986
- A bunch of manuals
- Some copy-pasted lines from the Atari 8-bit newsgroup

a) ASSEMBLER

- 130XE+ Makro Assembler (disk)
version, year : 2.2, 1992
author/company : Torsten Karwoth
available..... : freeware, ?
package..... : assembler, editor, menu, monitor,
batch enhancement, linker/packer
features..... : macros
Two pass 6502 assembler with integrated menu, editor
and monitor shell. Needs extra RAM banks. Source
format is derived from Atmas Makroassembler.

- A65 (disk)
version, year : ?, 1989
author/company : Charles Marslett, WORDMARK Systems
available..... : freeware, ?
package..... : assembler, manual
features..... : source include
Two pass 6502 assembler. Source format is based on the
Atari Macro Assembler. Assembler source included.

- Alfasm, Turbo-Assembler/16 (disk)
version, year : 1.0, 1990
author/company : Jeff Williams, DataQue Software
available..... : ?
package..... : assembler, docs
features..... : source include
Two pass 6502/65816 assembler.

- Atari Assembler/Editor (cart)
version, year : ?, 1981
author/company : Atari
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : -
Two pass 6502 assembler with integrated editor/monitor

- Atari Macro Assembler (disk)
version, year : 1.0C, 1981
author/company : Atari, APX
available..... : ?
package..... : assembler, editor, debugger, manual
features..... : macros, source include
Two pass 6502 assembler.

- Atmas Makroassembler (disk)
version, year : 2, 1985
author/company : Peter Finzel, Hofacker
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : macros
Two pass 6502 assembler with integrated editor/monitor.

- Bibo Assembler (disk)
version, year : ?, 1986
author/company : Compy-shop
available..... : ?
package....... : assembler, editor, monitor
features...... : source include, data include
Two pass 6502/65c02 assembler with integrated editor/
monitor.

- Datasm/65 assembler (disk)
version, year : 2.0, 1981
author/company : DataSoft Inc.
available..... : ?
package....... : assembler, editor, menu, manual
features...... : -
Two pass 6502 assembler.

- EASMD (disk)
version, year : 1.0, 1981
author/company : OSS
available..... : ?
package....... : assembler, editor, monitor
features...... : ?
Two pass 6502 assembler with integrated editor/monitor.

- Fast Assembler (disk)
version, year : 1.5, 1995
author/company : MMMG Soft
available..... : ?
package....... : assembler, editor, disassembler
features...... : ?

- Kasm65 (disk)
version, year : 2.41, 1994
author/company : Ken Siders
available..... : shareware, umich
package....... : assembler, editor, linker, docs
features...... : macros, relocation, source include,
conditional assembly
Two pass 6502 assembler. Relocatable object files are
compatible with ra65. Source format is derived from
the Atari Macro Assembler.

- MAC/65 Macro Assembler (disk|cart)
version, year : 2.00, 1982
author/company : Stephen D. Lawrow, OSS
available..... : ?
package....... : assembler, editor, monitor, manual
features...... : macros, source include
Two pass 6502 assembler with integrated editor/monitor.
Mac/65 is a direct descendant of the Atari Assembler/
Editor (via EASMD).

- MAE (disk)
version, year : .96, 1996
author/company : John Harris
available..... : umich
package..... : assembler, menu, editor, monitor, docs
features..... : macros, source include, data include,
conditional assembly
Two pass 6502/65816 assembler with integrated editor/
monitor. Extra RAM supported.

- NASM65 (disk)
version, year : ?, 1992
author/company : Nat!
available..... : ?
package..... : assembler, linker, librarian
features..... : macros, relocation, source include
One pass 6502 portable cross assembler (initially for
the ST). Highly compatible with MAC/65.

- PC-65 (disk)
version, year : 1.0 beta, 1996
author/company : Jan Feenstra & Freddy Offenga
available..... : mailto: F.Offenga@student.kun.nl
package..... : assembler
features..... : macros, source include, data include,
boundary directive
Two pass 6502 cross assembler for the PC. The source
format is highly compatible with the ST-65 assembler.

- Quick Assembler (disk)
version, year : 1.0, 1990?
author/company : JBW, Avalon?
available..... : ?
package..... : assembler, editor, menu, debugger
features..... : source include
Two pass 6502 cross assembler with integrated editor.
Very user friendly menu environment.

- Ra65 (disk)
version, year : 1.0, 1989
author/company : John R. Dunning
available..... : public domain, umich
package..... : assembler, linker, librarian
part of cc65 (c-compiler)
features..... : ?

- Synassembler (disk|cart)
version, year : ?, 1982
author/company : Steve Hales, Synapse Soft
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : source include
Two pass 6502 assembler.

- ST-65 (disk)
version, year : ?, 1991
author/company : A. Stauffenberg, F. Offenga
available..... : mailto: F.Offenga@student.kun.nl
package..... : assembler, menu shell, manual
features..... : macros, conditional assembly,
source include, data include,
boundary directive
Two pass 6502/65c02 cross assembler for the Atari ST
written in 68000 assembly. As far as I know this is
the first assembler with the boundary directive.

b) BASIC

- A BASIC Compiler (?)
version, year : 1.03, ?
author/company : Monarch Data Systems
available..... : ?
package..... : BASIC compiler
features..... : ?

- Advan BASIC (disk)
version, year : ?, ?
author/company : Advan Language Designs
available..... : ?
package..... : BASIC compiler
features..... : ?

- Atari 800 Basic (disk)
version, year : 1.0, 1981
author/company : Microsoft
available..... : ?
package..... : ?
features..... : ?

- Atari BASIC (cart)
version, year : Rev.C, 1983
author/company : Atari
available..... : standard ROM in Atari XL/XE
package..... : BASIC interpreter, manual
features..... : pretty plain BASIC implementation

- Atari Microsoft BASIC II (cart)
version, year : ?, 1991
author/company : Atari
available..... : ?
package..... : BASIC interpreter
features..... : ?

- BASIC A+ (disk)
version, year : 3.05, 1981
author/company : OSS
available..... : ?

package..... : BASIC interpreter
features..... : ?

- BASIC XL (cart)
version, year : ?, ?
author/company : OSS
available..... : ?
package..... : BASIC interpreter
features..... : ?

- BASIC XE (cart)
version, year : ?, 1985
author/company : OSS
available..... : ?
package..... : BASIC interpreter
features..... : ?

- Turbo Basic XL (disk)
version, year : 1.5, 1985
author/company : Frank Ostrowski, Happy Computer
available..... : ?
package..... : BASIC interpreter, compiler (V1.1)
features..... : ?
Published in the German magazine "Happy Computer".

c) C

- ACE C (disk)
version, year : ?
author/company : John Palevich & Ralph Walden
available..... : ?
package..... : ?
features..... : ?
This is a newer version of 'Deep Blue C'.

- C/65 (?)
version, year : ?
author/company : OSS
available..... : ?
package..... : ?
features..... : ?
Probably derived from Dr.Dobbs "Small C". Compiles to 6502
code which emulates the 8080 instruction set.

- C65 (?)
version, year : ?
author/company : Keith Ledbetter
available..... : ?
package..... : ?
features..... : good macro assembler
This compiler does not support structs.

- CC65 (disk)
version, year : 1989
author/company : John R. Dunning
available..... : ?
package..... : compiler, linker, assembler, librarian
features..... : ?
Public domain compiler. Also used as cross compiler.
Relocatable object linkage files, and the most thorough
K&R C for the 8-bit. Comes with an relocatable assembler.

- CC8 (disk)
version, year : 2.3
author/company : John Palevich & Steve Kennedy
available..... : ?
package..... : Compiler
features..... : ?
ACE C with more "real" C support (e.g. arrays of pointers
to structs). Requires ACE C runtime libs and linker.

- Deep Blue C (disk)
version, year : 1.2, 1982
author/company : John Palevich, APX
available..... : ?
package..... : Compiler, Linker
features..... : ?
Deep Blue C was originally an independent product, but it
then became available from APX. It converts C to pseudo-
code and then interprets the pseudo code (8080 instruction
set emulation).
Drawn from Ron Cain's public domain C-compiler (Small-C).

- DVC C (disk)
version, year : 1.05, 1985
author/company : Ralph E. Walden
available..... : ?
package..... : Editor, Compiler, Optimizer, Linker
features..... : Quite user friendly program
The compiler generates special object files (.CCC)
which can be optimized and linked. The package uses a
special DOS called DVC DOS which contains runtime stuff.

- LightSpeed C (disk)
version, year : 1.08, 1986
author/company : Clearstar Softechnology
available..... : ?
package..... : Compiler, Optimizer, Linker
features..... : ?
Runs under CLI DOS's and MENU DOS's.

- Tiny-C
version, year : ?
author/company : OSS
available..... : ?

package..... : ?
features..... : ?
First sold C compiler by OSS. This compiler was used to
compile itself! First true language "bootstrap" on any
8-bit machine (it was also available for Apple and CP/M
machines). Derived from Dr.Dobbs "Small C". Compiles to
6502 code which emulates the 8080 instruction set.

d) PASCAL

- Atari Pascal (disk)
version, year : 1.0, 1982
author/company : APX
available..... : APX-20102
package..... : ?
features..... : ?

- Draper Pascal (disk)
version, year : 2.1, 1989
author/company : Norm Draper
available..... : ?
package..... : ?
features..... : ?

- Kyan Pascal (disk)
version, year : 1986
author/company : Kyan Software, APX
available..... : ?
package..... : editor, compiler, linker, macro-assembler
and manual
features..... : ?
Kyan Pascal would run off a single floppy. The Atari (APX)
version needs two drives. A version which runs entirely in
128k should be available too.

e) LISP

- INTER-LISP/65 (disk)
version, year : 2.1, 1981
author/company : Special Software Systems, DataSoft
available..... : ?
package..... : ?
features..... : ?

f) FORTH

- ValForth (?)
version, year : ?
author/company : Valpar International
available..... : ?
package..... : ?
features..... : ?

- Extended fig-Forth (?)
version, year : ?
author/company : APX
available..... : APX-20029
package....... : ?
features...... : ?

- fig-Forth (disk)
version, year : 1.4s
author/company : ?
available..... : ?
package....... : ?
features...... : ?

- fun-Forth (?)
version, year : ?
author/company : APX
available..... : APX-20146
package....... : ?
features...... : ?

- Grafik-FORTH
version, year : ?
author/company : ?
available..... : ?
package....... : ?
features...... : ?

- QS Forth (?)
version, year : ?
author/company : Quality Software
available..... : ?
package....... : ?
features...... : ?

g) PILOT

- Atari PILOT (cart)
version, year : 1980
author/company : Atari
available..... : ?
package....... : ?
features...... : ?

h) LOGO

- Atari LOGO (cart)
version, year : 1983
author/company : LCSI, Atari
available..... : ?
package....... : ?
features...... : ?

i) All the rest

- Action! (cart)
version, year : 1983
author/company : OSS
available..... : ?
package..... : compiler, editor, monitor and library
features..... : fast compiler which generates good code
Needs cartridge for runtime procedures. A PD runtime
library is also available.
All variables are static, so recursive routine calls
are not possible. No floating point type (though a
PD library should make this possible). No arrays of
objects (arrays of POINTERS to objects are possible).

- Quick (disk)
version, year : 2.0, 1990
author/company : Raindorf Soft
available..... : ?
package..... : ?
features..... : ?
This is the "poor man's Action!". Same restrictions as
Action! apply also to Quick. Further restrictions are:
only simple assignment expressions, no records and no
pointers.

- Test Computer Language (disk)
version, year : 2.2, 1985-1990
author/company : D.Firth
available..... : public domain, ?
package..... : compiler and editor
features..... : ?

Subject: 13.14) What is the Atari XEP80 Interface Module?

This section written by: mailto:raukamp@dame.de (Thomas Raukamp)

Since the development of the Atari 8-bit line of computers in 1979, users
wanted better text displays than the default 40x24. There has been some
attempts to satisfy this need, like the Austin-Franklin board or the Ace
80/80xl cartridge. For more informations about these modifications read The
Atari 8-bit Hardware Upgrade FAQ from mailto:david_p@storm.ca (David A.
Paterson)

The Atari XEP80 Interface Module is Atari's entry to the 80 column field. It
lets a XL, XE, 400 or 800 computer system display a full 80 columns across
your monitor screen. The XEP80 provides a 256-character wide by 25-line
display window. Up to 80 characters are displayed horizontally at once, and
you can scroll horizontally all the way to the 256th character, depending on
the application you're running. The XEP80 is connected to your system via a
joystick port.

The XEP80 Module interprets commands from the computer for screen display or
output to a printer. The module is supplied with an industry-standard 8-bit

parallel port so you can connect a parallel printer to your Atari 8-bit (I even use a HP LaserJet IV on my 130XE ;)).

All programs that use the standard screen call (E:) should be compatible with the XEP80 Module. The software provided by Atari supports a 320x200 graphics mode - this mode only support direct bit images. Note that you can't use all of the standard graphic capabilities of the Atari anymore.

Although Atari recommends a monochrome monitor for usage with the XEP80, it runs fine with any type of composite monitor. The output looks great on my Commodore 1084 for example.

Along with the module comes a software-package containing an AUTORUN.SYS file, which is the XEP80 handler. If you want to use the module with an application that is compatible with the XEP80, which has it's own AUTORUN.SYS file, you can append the application's AUTORUN.SYS on the module's AUTORUN.SYS.

MAE and its previous standalone editor ED

Subject: 13.15) What makes some XL/XE software incompatible with the 400/800?

Konrad M.Kokoszkiewicz, mailto:draco@mi.com.pl writes:

XL/XE software won't work on 800 if:

1) it uses shadow RAM at $C000-$CFFF and $D800-$FFFF
2) it uses RAM expansions at $4000-$7FFF controlled by PORTB $D301
3) it uses specific XL OS functions (like JNEWDEVC)
4) it uses illegal XL OS addresses.
5) it uses European Charset :)

Subject: 13.16) What games run only on the 400 and 800 models?

The following are reported as incompatable with models other than the original Atari 400/800. Most probably do work on XL/XE's if you use a translator to run the original 400/800 OS on your XL/XE.

Apple Panic Broderbund
Aquatron Sierra On-Line
Atlantis Imagic
Attack at EP-CYG-4 (by Bram) Romox

Subject: 13.17) What games make use of the Light Gun?

mailto:jmouchmino@aol.com (Bertrand M. (LEXX)) writes:

Bug Hunt, Barnyard Blaster, Crossbow, Crimebuster, Operation Blood, Operation Blood II - Special Forces (not completely sure about that one), Light Gun Blaster (PD), Gangsterville (Italian game written in BASIC), maybe a couple more...

Bertrand M. (LEXX)

James Bradford mentions:
"On the 400, the light gun /pen will only work in joystick port 4." This renders much light gun and light pen software unusable on the 400.

Subject: 13.18) How do I type a tilde (common character in Web URL's) on my Atari?

The Shadow, mailto:The_Shadow@spnt.com writes:

The question is: "How do I type the tilde or squigly line which is in most web addresses? I don't have a key for it..."

Answer: The tilde is an inverse backspace on the Atari 8-Bit which can be very hard to type depending on the term program you are using, however you can insert the hex equivalent very easily, which is %7e in place of the tilde and it will work just perfectly. Do not put a space either before or after the %7e.

I (Michael) add:

Some advanced Atari software supports the tilde character natively. E.g., you can type a tilde in Ice-T with the Atari Logo/Inverse Video key.

Subject: 13.19) What's the difference between ASCII and ATASCII?

David Moeser -- erasmus att iglou dott com -- produced this nice translation table.

ASCII TRANSLATION TABLE -- IBM & ATARI 8-BIT (ATASCII)

<diespamdie!!!mindfield@home.com> writes

>>What is an easy way to tell the difference?
>>
>>Tim L.
>
>It's a 130XE. The 65XE had no expansion port.

Whoo-hoo! Rare 65XE for sale over here then...

The 130XE and 65XE use the same motherboard in Europe, with the RAM not
fully populated - so this check certainly doesn't apply here. Why other
versions may have the expansion omitted beats me...

Look underneath. It should have 65XE or 130XE written on the FCC/Serial
number plate.

Richard

Message-ID: <8f1t8a$j9g$1@bob.news.rcn.net>
Source record: 45081

Hey, Richard,
How do I do this?
> Post the votages you get at each pin, turn on the verbose mode of the
> software on the PC side so it shows you things like command line going
low.
> You'll know the menu when you get it up.

I can't seem to find my multi-meter(NOT DIGITAL). I was able to find out which wire goes to which pin by using a simple circuit with a battery tester and a AA Battery. If you (or anyone else) can help a non-technical person please, do so!

Thanx again for everybody's help!

2715. 810 Versions?

I want to buy an 810, but want to make sure that I'm getting the same drive that I originally had. Are there different versions of the 810? For example, with different drive mechanisms? I had one with a "flip-tab" door, but somehow I think I remember seeing other types, maybe with the rotating-handle type of drive that the 1050 had. I'm not sure

I want to avoid the same issues that I had buying a 410; I've got about three of those now and none of them are the original style that I had way back when!

Thanks for any info!

Is there one for the real Balblazer? The one with the multitasking
intro while the game loaded? All I've ever found is Ballblaster, the
file version with no intro.

The 65XE was the first XE I owned before upgrading to a 130XE and
then, finally, a 320XE (custom mod, not Rambo or anything) and after I
inadvertantly destroyed my 800XL's keyboard. It had a cartrige port,
but no expansion port (which was my primary reason for upgrading 'cos
I wanted an MIO) I'd originally bought the 65XE 'cos it was within my
price range at the time, but I always brooded about its lack of an
expansion bus.

Nah... 'cos even if the Tramiels released it, they'd never have
properly marketed it, and it would have gone the same way the
ABAQ/ATW, PCx models, and all the other good-ideas-with-non-existant-
marketing had gone.

If the Tramiels paid more attention in marketing class, they might
have actually made roaring successes out of the Lynx, Jaguar, and
XE/ST/TT/Falcon machines.

Well, cheapest DVM are about $20, and you could buy a sio2pc cable for that much so if you don't find it, no problem

Last time I mailed one out, it was $.99 for a blister pack and $1.60 for postage. If you pay the round trip postage I will fix it for you. Run you $5 and I will tell you what was wrong.

Did you get a chance to turn on the verbose menu to see what the lines were doing?

There are only a few other things you can tell w/o a DVM. For instance, if you boot up hyperterm or any other terminal program at 19,200 baud on the IBM and cold start the Atari you should get some odd characters on the IBM screen. That would mean you have the Atari data out and IBM data in wired right. Few other things like put the terminal in answer mode and it may auto answer if you have the RI pin wired right. That would narrow it down quite a bit, not that much left that could be wrong.

Not sure about the mechanisms being the same, but internally there are
definately different types. I have one of the early 810s, serial number
~1000, and it only has two boards inside compared to later models with
three.

I have installed DirectX 6.0 with only ONE problem - - -
My 'joystick.dll' won't install in the right location.
I went to my computer manufacturer's web site to download a controller utility and was 'lucky' to find one that works in Windows' hidden DOS.
I am still without my 'joystick.dll' but I copied the 'joy.cpl' from a CD-ROM that had both DirectX 3.0 and DirectX 5.0 on it.
My computer now works on some of my games but others are still troublesome.

The Atari 810 drives had mechanisms from MPI and Tandon. They had
different style latches.

Yes, a data separator board was added to the later 810's.

The original 410 I had bought in 1979 had a flat top, with just slightly
rounded edges. The three 410's that I've bought in modern times have a
~8mmx12mm notch around the edge, but otherwise have about the same
foot-print as the original 410 (nothing like the 1010).

Someone awhile back told me the that these older 410's were called by some
specific name, but I can't remember what it is... One day I've got to get
me one!

2729. Do 400/800 carts work with 65XE?

That's the info I was looking for. How different are the latches? I seem
to remember the innards of mine were Tandon from needlessly adjusting the
drive speed. Is this drive going to be hard to find?

XEGS didn't have the expansion port. It has pastel colored buttons
(Start/Option/Select/Help)

The 65XE is a 64K version of 130XE. At least mine is.

If we read the FAQ, our questions are answered. The 65XE NTSC version
lacked the expansion port - PAL versions had the expansion, but still
lack Freddy and the paging controller.

Technically, the 800XE is a 64K version of the 130XE.

There are 2 mechs. Tandon and mpi. one is the flip tab and the other
has a latch type door that moves up and down.

Internally, early 810's had 2 boards. latter ones had 4 boards. The
rear board in each is different. The Latter 810's also had a data
seperator board pluged in to the side board and a analog board that
sat on top of the mech.

Mostly, they do. There are some that don't, not because they don't
fit, but because the software writers cheated with there code and
jumped directly to places in the OS.
That can be fixed by fitting an early os to the XE. It is best to have
a switchable between the 2 for maxium software compatiabilty.

If it is going to be a collection item, then it probably doesn't make much difference, but the data separator board made a BIG difference in the performance of 810's.
I think this was standard from 1982 forward.
Also, never saw an 810 with a rotating locking lever (ala 1050), or on any full height drive for that matter.
Larry

The real Ballblazer/Blaster FULL disk has been available for a while now, I
asked re this and the Full Rescue on Fractulas and the full released
Spelunker a while back and all three FULL versions are around.

Email if interested or I can post them on the binaries group?

Well, without going into my war room to dig one out, the Tandon
had a narrow latch, perhaps 20% of the drive width that rotated down. The
MPI's latch was full width and just came straight down. It's been a
while! 810's are not hard to find. From my experience the Tandon's were
more common.

I never saw a full-height drive with the rotating lever (1050) either, I
just couldn't remember what the other version was.

Looks like I had the Tandon mech, which is also the name that sticks in my
head. I probably finally got an 810 in 1982 (yikes! I got the 410 in
1979).

Thanks to everyone for the help (inc. Sage)! Now I've got to find me a
Tandon 810...

-Rhett

PS. On a side note, my 810 would erase tracks on the disk if you turned
the drive off with a disk in (regardless of the write-protect setting). I
can't remember which tracks, but I want to say sectors 2 and 3? I think I
always had to rewrite DUP.SYS to fix thses disks (I think; it's been 17
years, ok?). Anyone else remember this? How do I find a drive that will
faithfully recreate this delightful experience?

As far as I know, there was only one kind. I still have my original one
and it still works. I was thrilled to death when I got it which greatly
overshadowed the fact that I paid $500 for it.

I have the following Atari Force Comics, for sale or trade, all are in mint condition. If you have any questions in regards to cover art, etc., please feel free to ask.

Atari Force Comics Please make an offer
==========
All are in Mint Condition, some multiples available
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

If you are interested in any of these items, please use this link to contact me jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.Comics (removing the NOSPAM first).

Please make all offers in U.S. Funds (buyer pays shipping), I am also willing to trade for or towards rare or shrink-wrapped/sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- A working first generation Dish Network receiver
- A working 4000 series Dish Network receiver
- Working DSS H or HU Cards
- And of course the ever popular, original Intellivision keyboard (should I be so lucky :)
- Atari Force Issue #1 (January 1984)
- Atari Force Issues 4 thru 7
- Atari Force Issues 12 thru 20

I diddn't know there was a lot of difference. Of course, I am young and naieve
and my 810 is older than I am. Thanks for that tidbit of info. Now, if anyone
asks, I know I have an MPI drive.

Actually, the keyboard was probably installed as an aftermarket item. They are quite common in my experience and are not hard to find. Many people probably got tired of punching those hard flat keys. I know I did when I was a little kid and played with my "laptop computer" that my mom bought me (a talking whiz kid circa 1987 {i'm 16}). Frustrating.

Wally
w_a_lang@willinet.net e-mailed me this message. He's having trouble
posting responses so I put it up for him.

Yes they do, to the most part, work with the same cartridges.
The Atari 65XE was designed and built to the same standards as the Atari
400/800 was.
This includes the Atari XL series as well.
Atari while it was owned by Warner Communications made its XL machines 95%
compatible with the earlier 400/800 machines.
Later when Jack Tramiel bought Atari from Warner he had made those machines
under an agreement to retain compatibility.
The Tramiel Atari XE machines were anywhere between 96% and 98% compatible
with both earlier 8-bit formats.
I know this because I am an amateur Atari historian and a devout Atari game
player,
Wally

chicken works for me on all of my atari 8-bits,and i advertise it as
xl/xe compatible.
there is however some slight differences in xe's that you may have some
trouble with on chicken but as far as mine are concerned,i have not had
any trouble.
a few romax titles are 400/800 only.
slime from synapse is 400/800only,as is picnic paranoia, protector
II,and ft. apocalypse, and shamus case one:(
astrochase from parker bros. is 400/800 only.
atari's own kangaroo is 400/800 only,also there ms. pacman has some
troubles sometimes on certain levels,and machines.
one of my favorites is gorf from roklan its 400/800 only.
jawbreaker II is also incompatible,as is pool 400 by isdi.
demon attack by imagic is also incompatible.
many will work with the translator cart.
on 65xe's,and 130xe's,if you are having trouble with carts is to check
the cart port for bent cart slot pins,i have found out that many owners
of these machines have trouble with the rear cart port location,and
install,and remove carts at a angle thus bending pins,then you will not
get proper contact,thanks,
lance

2756. Re: SIO2PC Cable troubles

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-07 00:00:00 UTC
From: Alan Sharkis <asharkis@erols.com>
Message-ID: <8f4lcf$4lm$1@bob.news.rcn.net>
Source record: 45025

Let me get this straight.

He built the cable, it doesn't work, and everyone is suggesting that the problem is in the cable.

There's one thing else to try that would be easier than checking voltages, etc.

Is it a one-chip or a two-chip cable? I know that for two-chip cables there has to be a change in something in the program (the docs tell you how.)

Just a guess.

Source record: 45030

oh, don't worry..... your 810 will faithfully reproduce the problem. It is really a controller problem with the old chips. The newer ICs will not splatter data on power cycles. On the old 17xx chips, wherever the heads happened to be could be erased when the power went off because the erase heads were pulsed. The "normal" drives (8" mostly) ran the main drive all the time and only loaded heads when reading or writing. When you powered down, the heads weren't touching the media so the erase pulse was not a problem. Along comes Atari who has the heads loaded all the time and poof - erased data.

Bob

2764. Re: Atari Disk Drive Questions

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-07 00:00:00 UTC
From: rhamiiton5@aol.comedy.com
Message-ID: <20000506211056.10469.00001574@ng-bh1.aol.com>
Source record: 45094

>Tim Lappala blablabla@execulink.com
remarks:
>Do I need to format a disk before I can use it in my 1050 disk drive?

Blank Diskettes must be formatted before the 1050 can read/write them.
Commercial programs came ready to run.

>If so, how do I do it?

Type DOS from the BASIC READY prompt and use DUP.SYS Menu option "I" or choose
"Initialize Disk" from the DOSXL Menu or type "INIT" at the DOSXL command
prompt with a master disk in drive one. Alternatively, type "INIT" or "XINIT"
at the SpartaDOS prompt with master disk in drive one... This all assumes the
system was booted with a DOS master disk.(see below)

>Also, what commands do I use to load and save programs?

IF they are BASIC programs, use:
SAVE"D1:FILENAME.BAS" at READY prompt or LIST"D1:FILENAME.LST"; you can then
LOAD"D1:FILENAME.BAS" or ENTER"D1:FILENAME.LST" to retrieve. Make sure load
goes with save and enter goes with list! Basic commands are on this site:
http://members.xoom.com/Pairman/Ref.html
and DOS 2.5 manual is on this one:
http://www.crestviewfl.com/~richard/atari-docs.htm

Commercial games usually boot by 1) power up the drive empty, 2) insert the
disk, 3) power up Atari 8-bit.

-Ron

I don't have a solution but I admire the problem.

Just a by the way, charter of the group is no binaries so we can get carried by more newservers.

Looks like several things, or one big one. You have Atari Green going to pin 8 instead of pin 1, and several other pins making the same 180 degree rotation. Didn't bother to check every connection, but you plugged the 1489 in upside down. Just pull it out and plug it in with the other way.

>went into the RIGHT slot of the Atari 800 won't work

Probably 'cos the right slot was designed to load (or replace) Atari
BASIC (or the whole OS in general). Stuff made for it probably won't
work on the XL/XE for the simple reason that this all became
integrated and so only one slot was necessary.

2771. Start/select/option key problem

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-08 00:00:00 UTC
From: Abe Pinter <pinter@phri.nyu.edu>
Message-ID: <39168B1B.BEED5525@phri.nyu.edu>
Source record: 44951

I'm having a perplexing problem w/ an 800 I bought used. The machine
works
fine, except the the Option, Select, and Start keys do not work. System
reset
works fine. Software which does not require the malfunctioning keys
boots and
runs perfectly. So, I took the machine apart thinking a simple
mechanical problem
w/ the keys could be solved easily. Not so. Using a multimeter I
determined that
when depressed, the problematic switches did indeed complete the
corresponding
circuit. So, I booted the machine and "artificially" completed the
switch circuits
w/ a bit of wire. Still, only the sysytem reset switch worked. Finally,
using the
multimeter I traced the switch circuits on the PCB as far as I could.
Everthing
was fine. The only notable difference my inexperienced eyes could
detect between
this machine and others was a non-Atari RAM module (I think it is 48K,
is their any way to tell?) along w/ the ATARI ROM and ATARI 16K RAM
modules. Any ideas?
Thanx in advance.

BTW, this 800 was still a steal for $25. It came w/ a 1050 and 410 which
work, and
approx. 350 floppies full of useful pirated software. I thought I had
heard of or played
most 800/XL games, but Murder on the Zinderneuf?, Hacker? Cool stuff.

(Says Atari BASIC was produced by OSS.)
OSS came a little after Atari BASIC was written mostly by Paul
Laughton and Kathleen O'Brien, from Shepardson Microsystems.
You may be right that Rev. B and C came from OSS or Atari corp
, but the original A version came fro SMI, and DOS 1.0, too I think.
O'Brien and Laughton weren't part of OSS. Bill Wilkinson was at SMI and
contributed
a little to Atari BASIC rev. A, and a little later started OSS.

(I apologize for not directly quoting).
Wally said SMI changed its name to OSS.
I'm not sure about that. Bill Wilkinson came here a few years back.
and pointed to Laughton's web page I think. there was more history
there.
But I do have 'Atari BASIC Source Book', by Wilkinson.
Bob Shepardson was SMI head. I don't know what happened
to SMI after Wilkinson left, I guess to form OSS, but I don't
think Shepardson would have changed the name to OSS.
I'll look for that Paul Laughton site.
The main thing I was trying to say was that Atari BASIC, Rev. A
was before OSS.

I found some info at http://www.laughton.com/paul/abps/oss/oss.html

Now I'm not a careful reader, but as I read a little of what's there,
Bill Wilkinson bought the rights to Atari BASIC from SMI. Atari
Corp. didn't actually own Atari BASIC! SMI retained the rights
to it. And Bob Shepardson sorta fired, or let go Wilkinson, I think
Wilkinson says something like 'Shepardson decided employees were'nt
worth the cost in terms of the money they brought in'.

START, SELECT and OPTION are sensed by the GTIA chip - all other keys are
picked up by POKEY (except RESET). You may have a bad GTIA....

I always thought that the SMI company was acquired by OSS.
There is the matter that Atari had not owned their own BASIC for
the first few years of the Atari 8-Bit Computer's life.
The IDE company did for certain purchase OSS some year later.
I think that was the initials of that company.
IDE (whatever) produced hardware for the Atari while OSS had
produced software for the same computer systems.
Atari NEVER really made things clear concerning their computers
for they [like IBM] contracted part of the work to others.
Mainly they did during the Warner Communications years.

> laptop so I am having problems emulating the joystick.
> Can I change the settings in the program to asign keys to stick?
>
> Peter
>
>
I suggest that you go to Ziff-Davis's web site and download the following
six DirectX installation utilities:
+ DirectX 3.0
+ DirectX 4.0
+ DirectX 5.0
+ DirectX 6.0 (dx6eng - if older Windows 95)
(dx6cfg - for Win95B or Win95C/98)
+ DirectX 6.1 (dx61eng - for Windows 95/98)
http://www.zdnet.com/
Ziff-Davis retains an archive of hard-to-find utilities.
Some of these DirectX versions may be harder to obtain.

I suggest that you go to the Microsoft web site and download
the DirectX enhancer utility for DirectX 6.0 which is at
http://www.microsoft.com/
Avoid Microsoft's troublesome DirectX 7.0 if possible.

I suggest that you use your Game Controller command in your
Control Panel in your Windows 95/98 in either the My Computer
or in the Start Menu under the Settings.

I would think the NTSC version would have been released first, being that it is an American company. PAL versions generaly have different features than NTSC, many of which are beneficial compared to its American counterpart. Then again, I just gathered this from my limited knowledge of the 8Bit line, but I am learning, slowly :)

They should work just fine. There are few changes in OS between the
XL and XE line. The only times you ever run into problems with
incompatibilties is when you run a few old programs written for the
400/800 line that used certain functions that weren't supported quite
the same on the XL/XE line. For these you need a Translator disk,
which basically installs memory-resident OS patch that allows you to
run those old games. (Alley Cat is one such game that comes to mind
that required the translator disk)

>some not.
>
>TIA

Which ones won't? 8-bit file games usually had varied extensions;
.EXE, .OBJ, .BIN, etc. Some didn't even bother with extensions, the
executables sometimes using the extension as a sort of carry-over to
give the filename a little extra breathing room (i.e. RUNTHISF.ILE) --
that was usually a personal thing some people did, though.

Some games, as I said in an earlier message, that were designed for
the 400/800 line may experience some incompatibilities with the XL/XE
OS, so you need to load them using the 400/800 (OS-A or OS-B) ROM.
(The emulator equivalent of either using a real 400/800, or an XL/XE
with the translator disk)

>
> I don't have a solution but I admire the problem.

---now is the important information:
Atari issued three different versions of its BASIC language cartridge.
+ Atari BASIC Rev. A only had a minor code error.
(This was actually written by Optimized System Software under contract.)
+ Atari BASIC Rev. B actually tripled the error codes.
(Warner's Atari attempted to correct the cartridge themselves -- big
mistake!)
+ Atari BASIC Rev. C was properly rewritten, eliminating the errors.
(Tramiel's Atari went to Optimized System Software to write it again.)

In some ways... Of course, you couldn't plug in a 12 button, 6 axis
controller and expect it to work with existing games. You can do that
with DirectX.

Also note that there are some differences in the way early (CTIA) 400
and 800 machines display things relative to later GTIA machines. In
particular, you may notice CTIA games whose text refers to something as
being blue when it's actually orange on the newer machines, and vice versa.

If you think *that's* mutant, check out the DINA video game systems that Telegames sells... They have one slot for Colecovision games and one for Sega SC-3000 carts.

More or less. Rev A had a number of bugs, not just the commonly described crash bug. Rev B fixed most (maybe all, I don't remember) of these, but in the process, they added a new bug. You see, the crashes were caused by a bug in one of OSS's memory move routines. When the bug was fixed, the fix mistakenly applied to a routine that actually worked in Rev A, causing the new lockup problem.

Rev C differs in only a few bytes. AFAIK, the only change was to remove the alteration made to the routine that was broken by Rev B.

You can get more details from the annotated source listing published by Compute! books. Bill Wilkinson described many of the problems in detail. He also talked about it in his column in Compute! magazine.

Yes and no. american (NTSC) versions run slightly faster. so for any
given time period, the NTSC machine can do more.
PAL versions have a slower vbi rate and can run more code during the
vbi. this benifets games and demo's. Music and games that use the vbi
for playing/anamation will also be slower. There are also more screen
lines to use up so the Vcount register counts higher. What ever use
this is, I don't know.
All in all, atari did a good job of keeping PAL and Ntsc machines as
much the same as possiable.

Definitely is; that drive is not sending the signal that it even exists when the computer does its peripheral polling at power up! If it were, you would get the 'boot error!' message.

-Ron

I don't have a solution but I admire the problem.

success?

Have seen and tried to acquire but never owned a 1084; usually provide a great picture. One thing to consider is that the NTSC 800XL & 130XE did NOT (See Bob Woolley's AC articles) have connections to the chroma or luminance pins of the monitor jack - only the composite video and audio. Have to plead ignorance on the Pal models.

-Ron

I don't have a solution but I admire the problem.

>

I do but I would much rather not have to unsolder the IC from the good
drive to check it in the bad drive.

Much better to get new chip and just use that I think.

130XE most certainly does have both chroma and luma signals on the video
jack, been using that way for years.

Hi Greg,

Give the links at the bottom of this message another try. Let me know if you still have problems with them and I will email them to you. BTW- the server that hosts the archive is going to be moved shortly. After that it may be a week or two until it is functioning again.

As to the Mystery Science Theater text adventure, somebody else wrote the game. I took the source to it and compiled it out with Inform v. 5 (on the PC). Then I took the compiled Z-Code and the Z-Code interpreter and put them together on floppy disk for the 8-bit. I don't know if I still have the complete development system around, but I could put something together for anyone that would want to create new Infocom style games for the 8-bit. Just let me know of your interest in this in email.

I compiled several more Inform games for the 8-bit. Some of them were written for higher versions of the Inform compiler, but since they didn't make use of graphics of v. 6, it was easy to convert the v. 6 functions over to their v. 5 counterparts.

Best,
Tom

(Rick Cortese points out that floating point routines are part of the OS.)
Hmmm. I think Wilkinson did the Atari BASIC 'scheme' for floating
point. BASIC uses a binary coded decimal, or is that the OS?
I'm taking from 'The Atari BASIC Source Book', just the preface.
Paul Krasno did the transcendental routines, again of BASIC, I think, those
being the ^ powers and trig functions, aren't they? I don't know exactly
what the OS fp routines do, but I think BASIC still requires some
handling of those OS routines.
Which brings up my next question. Who did the A8 OS? Doug Neubauer
or Jay Miner (I think Miner was a hardware man.)?
So, I don't think Wilkinson did the OS fp stuff.

Shipping cost for an 810 makes fixing them almost out of the question unless
it has a lot of sentimental value.

I am a few projects behind, was going to get a double density drive to
Carolynn so she could read her old stuff<mostly done>, still have a disk I
made up and was supposed mail out 2 weeks ago.

That being said, what does your MS DOS situation look like? Path of least
resistance would be if 1) You have something that can run SIO2PC/APE
2) I send you a cable <parts and shipping is less then $5 including the
blister pack so this would be a freebie>.
3) You just download copies of the things you have off the net and run them
that way.

I only have one extra 810 and it is one of those B&C copies, actually looks
nicer then the real ones IMHO. I have a bunch of 1050s but like I said the
shipping cost last time I checked is over $12.

Two way shipping => you could probably buy 3 or 4 drives from Goodwill or
Salvation Army store for that much.

The only thing BASIC does is use the OS floating point routines. Like I
said, makes me kind of wonder how they decided they should put floating
point routines into something that was intended as a game machine. I am
pretty sure they are Wilkinson's. IIRC, he is like a lot of us in that when
he went to school there was no such thing as a computer science major, so he
has his degree in math.

Oh, heck.
I've asked a question that is answered in the c.s.a.8 FAQ.
Kaplan, Crane, Whitehead and Miller wrote the original 800/400 OS.
Doug Neubauer is the source of this information.
Sorry.
But, Wilkinson did the FP routines in Atari BASIC, not the OS FP stuff.

OK. So I don't know if Wilkinson did the OS FP routines.
As for putting FP routines in a 'game' machine, I don't think you could
do without them. I guess game consoles may not have had them.
If you're going to do a serious BASIC, or be able to make spreadsheets,
and even some games would benefit from FP.
I looked briefly at the source to Atari BASIC and there are sections
for dealing with BCD numbers and math. I suppose the OS FP uses
BCD numbers. Every number in Atari BASIC is a 6 byte BCD number.
That's why you save space using variables for common numbers like 0, 1,
etc.

Yeah, $40 is a little steep... we pretty much give away old 810s and even 1050s. Only XF551s and Happy/USDoubler drives really have any value --- like maybe $25 to $50 max. What you really pay for is the time to dig one out, test it, and pack it well. Come to an SLCC meeting and I'll give you one - or two --- you test them.... :)

Bob

How do you know they are bust? are you using software that requires them, they have no other use other than some boot up functions unless they are directly programmed for?.

>"Richard Cortese" ricortes@netmagic.net
remarks:

>go to DOS and do a binary save, something like
>D:EDASM.COM, $A000, $BFFF, $A000

I had not tried this with a ROM since about '83; it did not work with DOS 2.0 - I spent a long time with a sector editor fixing the file numbers, forward pointers, and byte counts in 66 sectors. The 2.0 write routine appeared to expect RAM and set those last 3 bytes for each data transfer and then restore them for the next sector.

DOS 2.5, MyDOS 4.5, TopDOS 1.5, and SpartaDOS do NOT share this fault; I tested each the other night with total success on the ASMED ROM. Now if we go into that file, and remove the header and the load and run vectors we are left with the ROM image which could be used by the emulator - might need to name it basic.rom to be accepted?

-Ron

I don't have a solution but I admire the problem.

No. the right slot can only address $8000,$9FFF.
The orignal reason was because when they where first designed, larger
rom/ram chips where so expensive that atari decided to have 2. one
for the program and the second for expention. As usual in the computer
industry. advances where made and things become cheaper. the second
cart slot became redundent. A bit of for thought by atari to put the
address decode and detect in the left slot for the right slot also saw
to that.
When origanlly designed the 400 was only going to have 8K ram. the 800
could be expanded with more ram when one could afford it. how things
have changed.

Source record: 44983

Config is:

Computer plugged into drive with standard cable.
SIO2PC cable nowhere in sight.
Drive has bootable disk inserted.

What happens:

Turn drive on.
Turn computer on.
Computer makes brief static noise.
Computer displays "Ready" on screen.

If I hold down "Option" the computer pauses briefly and then enters
the "Self Test" mode.

Looks like a hardware problem to me. :)

Cheers,

Rob.

2844. What Exactly Is The 3086 Chip In The 1050 Disc Drive ?

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-09 00:00:00 UTC
From: rob@syroxdev.co.uk
Message-ID: <3918f016.88437393@news.supernews.com>
Source record: 44984

Hi,

Further to my request for assistance with my "dead" 1050 drive I've
been trying to find a 3086 chip that buffers the serial ports on the
back of the drive.

I've checked both RS Componants and Maplins (I live in the UK) and
neither have this exact device.

Is there a generic component that I may purchase and fit in place of
the 3086 so that I can eliminate the possibility that it is a fault?

Many Thanks.

Rob Brooks.

Probably hard to find these days with emulators being so prevalent
(therefore allowing the switching of OSs easy) I think there were a
couple of translator disks available. The only one I ever used was a
boot disk and I believe came up with a blue screen telling you to
insert a bootable disk and hit START or somesuch. (It's been a long
time) I have an ARCed copy of a Discomm 3 file of the translator disk
if anyone wants it.

I've never had a problem using a DeskJet 500 with the A8. The only thing challenging was finding a way to build a lot of features into a PaperClip .cnf file--it only allows six bytes for each feature enable or disable code.

(Says ICD bought OSS.)
Right.
Then Mike Hohman's Fte bought ICD A8 stuff.
So I guess Mike Hohman now owns the rights to Atari BASIC.
And he's disappeared.
Wilkinson did the floating point of Atari BASIC.
They didn't have an A8 to work with, it hadn't come out yet.
So they used Apple IIs emulating the A8. and an IMP-16P,
whatever that was, for their cross-assembler, with punch
card input and paper tape output.

> It's a 130XE. The 65XE had no expansion port.

Hi,
But european 65XE models have an expansion port (like 130XE and 800XE).
Boot up any DOS with an XE Ramdisk handler and see what happens, if the
RD is there its a 130XE, if not a 65XE. You can also open the computer
and take a look inside. If you find 16 RAM chips a 8kbyte its a 130XE
(only 8 chips a 8kbyte is a 65XE), also if you find a Gate Array chip
its a 130XE. (On newer eastern european models Atari used 32kbyte chips
- 4 chips + Gate Array for 130XE and 2 chips, no Gate Array for 800/65
XE computers.) - Andreas

P.S. By the way there are some test programs (not the Self Test from
Atari!) for the 8bits avaible that test the OS ROM, Basic revision,
GTIA/CTIA, PAL/NTSC, avaiable RAM and many more things...

Hi,
Most older 400/800 carts also work on the XL and XE computers if they a) are not right slot only carts (less than 5 different carts!) or b) carts with illegal code (illegal+direct jumps to the OS or other 800 areas). For section a) I only know of Monkey Wrench, section b) covers games like Astro Chase (First Star Software / Parker), Demon Attacks (Imagic), Kangaroo (Atari, Prototype), Chicken or Slime (red cart from Synapse), ... Maze (from Epyx), Super Pacman or Pacman Jr. (prototype from Atari) and some others.

All in all less than 20 game carts. And there are not so many game disks or cassettes also, that will not work with the newer XL and XE computers. Always use a translator disk to boot these games (with or without Basic). The original Atari Translator only supports booting from disk, but there are several other translators that also allow booting from tape or cartridge. I personally use the "Ultrafix XL" from the "Happy" Hacker (Tim Patrick or so), which is avaiable as a disk file (and as a cart from Video 61). This tool allows booting from disk, tape and cart with or without basic and gives you some more options (48k or 52k RAM space, etc.). Have a look at it...
greetings - Andreas

Hello folks,
my one and only Diamond GOS cart has now been sold, sorry for all the guys that were interested, there was only one... But, on the other hand I have some PD desktop programs (PD and Freeware material on diskette) that I can mail -free- to anyone who is interested. The stuff contains 4 medium/dual density disks (8sides) with S.A.M., TOS XL, GOS 1 and 2, GOE 1 and 2 and Diamond GOS 1.0 (demo) plus accessories. All programs are disk-based, just mail me which imgage format you would like (ATR/DCM/XFD). And do not forget, you must be able to use (at least read) 1050 medium density... greetings - Andreas Magenheimer

They are just 5 high gain<110 hfe> transistors on a chip. There are quite a few manufacturers of them, RCA and National for sure. I suppose if you are desperate you could just use a 2222 or 3904<6? NPN anyway>.

The are a frequent problem with dead drives, since they buffer the signals on a 1050 or 810, your drive will exhibit systems like it is not plugged into the computer. It will spin up, seek track zero, that kind of stuff when you turn it on, but completely ignore the computer during the boot process.

It was a pretty good design choice to have the 3086 in there, they handle something like 300 mamps and up to 20V, but for some reason they blow. Could be something silly like the inputs are not diode protected from static discharge or something. Looking at the data sheet, it looks like they aren't protected.

Minor point, must of been an interesting story of how they decided to do it
that way, but since they stuck the floating point routines in the OS they
are there for more then just BASIC.

Sin, Cos, Atan, Sqr are in the Basic Rom. Everything else is in the OS.
According to Atari Basic Sourcebook:
Paul Laughton and Kathleen O'Brien - Most of Atari Basic
Paul Krasno - Helped with Trnscendental routines
Bill Wilkinson - Designed Floating Point Scheme
Bob Shepardson - Modified IMP-16 Assembler to accept special syntax tables
Paul invented
Mike Peters - Key punching and operating.

Oh, I am just P.O'd because I paid 40 bucks for my 810 on eBay. Had 75 disks with it, all are dead. Someone is sending me a copy of DOS 2.5 to see if my problem is DOS related. Anybody think I paid too much? I mean, as I said, I paid $10 for the computer itself and it works perfectly, but $40 for a dud?

> was to revise the formatting part of the program. (?)

When I use BBXFER 1.8 to copy file from the Atari to a PC disk, the files are cut to a certain lenght. If you copy multiple files in one session, all will be cut to the same lenght. Try it again a day later and the same files might have a different lenght than the day before. But again, all files will have the same lenght. I reported it to Bob. That was month ago. He told me he only changed the formating code. I heard from Matthias Belitz that he had something like that happen to him once too. (where you change one thing and something totally different develops a bug) He had used the same memory locations twice.

I have the schematics for a sound digitizer here that uses a Ferranti ZN449.
It uses 8 bits. Connects to the cartridge port. I don't have software to
support it. And it grabs all of $D5xx, so it would benefit from a bit of
extra address decoding.

If somebody wants it and maybe could put an electronic version on the net....

BTW It's not mine, but I have permission to pass it around as long as nobody
tries to make money off it.

>
>What is an easy way to tell the difference?

Yes, open it and look in.

NTSC 65XE's don't have an ECI port.
PAL 65XE's have an ECI (and the Freddy chip. Somebody said they don't)
If you have a European 65XE or a "new design" 130XE, the selftest will test up to 128kB of RAM.
European 65XE's (also sold as 800XE, mainly in Germany though) come in two versions. Some use 64 by 1 chips, others have 64 by 4 chips.

Rob.

2869. 1MB Upgrade. Ruff "scetch". For the impatient. Preliminary version. Solder jockies only.

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-10 00:00:00 UTC
From: nisse-ma@reze-1.rz.rwth-aachen.de
Message-ID: <8fbfh1$e2q$5@nets3.rz.RWTH-Aachen.DE>
Source record: 44935

Howdy folks

For the impatient.

Here's in short how my 1MB upgrade works.

REMEMBER:

- It works on my XEGS. But not yet on any of my other computers. This might be caused by the complexity of the upgrade.
- THIS IS NOT AN EASY UPGRADE. If you think the Newell Upgrade is tuff, don't try this one.
- Should you decide to upgrade you computer according to my description: IT'S YOUR DECISION, YOUR RESPONSIBILITY. I'M NOT TO BE HELD RESPONSIBLE FOR YOUR ACTIONS OR THE RESULTS THEREOF.
- As soon I have this upgrade working on atleast three different computers, I'll start preparation for a small production run for some PCB's. This will make the upgrade a lot easier and less time consuming.
- If you don't know how to open up your computer, STOP HERE!!!
- There is some desoldering involved.
- This is just a preliminary version for those who can not wait!
- I'll restrict this text to the XE(GS) as I'm doing this off the top of my head. But it will work on XL's too. If your 800XL has a Freddy chip, congratulations, this text is for you too. If your 800XL doesn't have a FREDDY (most don't) or if you have a 600XL, 1200XL or 14x0 XL(D), don't dispair. The upgrade will work. It will just be a bit different. But not much.
- Read this text from beginning to end and make sure you know what you are doing before you plug in the soldering iron.

You need:

1x 30 pin SIMM (1MB or up)
1x SIMM socket for above SIMM
1x 74LS273
1x 74LS158
1x 74LS08
1x 74LS04
Some precision sockets
A lot of time
Some tools
A cool head

and if you computer is not a 130XE:

1x CO25953 (gate array. Available at Best Electronics ($10.00) and B&C Computervision ($12.00).

If you have a 800XE (only sold in Europe) or a European 65XE open up your computer and check if the motherboard sais "130XE". In that case look for a white square marked U34. Desolder the ZERO Ohm "resistors" (all three of them) and all the holes belonging to U34. Solder a precision socket into this place making sure to leave four holes open at the RIGHT. Stick the CO25953 into the socket. Solder two precision sockets in the open space next to the existing RAMs. From now on, these computers are called 130XE, even though the case might say 800XE or 65XE.

For all XE(GS) computers.

Connect wires to the SIMM socket. You can leave out the wires intended for parity. We don't need them. If you never intend to use 4MB or 16MB SIMMs (30 pins) you can leave two more wires out. Make sure the wires aren't to short to begin with. 15 centimeters or 6 inches is about the minimum. You can always shorten them later.

Desolder the MMU. But be carefull, we need this one. They are only available at B&C and Best. Bend up the pins connected to PB0, PB1, PB7 and if you have a XEGS PB6.

BTW the XEGS uses a slightly different MMU as the other Atari's do. These are NOT interchangable.

Solder a socket where the MMU was.
Solder the 74LS273 on top of the MMU.
Solder wires from PB0, PB1 (,PB6) and PB7 to the LS273. Connect the outputs of the LS273 to the MMU.

If your computer is not a 130XE, but it does have a Freddy chip, desolder pins 23 and 24 of Freddy. And connect these to the appropriate pins on the CO25953. Also connect the rest of the signals to the CO25953.

Take PB4 and PB5 and AND them (LS08).
This signal is ANDed with the Phase Two clock (delayed or non-delayed doesn't seem to matter). This signal is then run through the LS04. The inverted signal is connected to the LS273 to freeze the signals leaving the LS273.

AND "CASBANK" and "REF". The new signal is used as the CAS signal for the SIMM.

Connect PB0, PB1, PB6 (on all computers) and PB7 to the LS158.

If you try this upgrade and it works: Congratulations! Make sure you use a couple of test utilities. Since this upgrade is more 130XE compatible that most others (if not all) and most programmers had thought possible, testutilities might not recognise the separate ANTIC and CPU banking (the page sequence will be wrong. It should include hex numbers starting with 0x, 4x, 8x and Cx.) or all of the upgrade. This is not a problem. Just make sure there are no timing problems.

If it works, let me know. If it doesn't, please check the upgrade and let me know.

If all works and you feel adventurous, get an extra PIA, solder it on top of the "old" PIA. Put it somewhere between $D304 and $D3FF (I'm gonna have to check out what addresses in this range are already used for other upgrades) using the LS04. Connect PB2 and PB3 and PB6 and PB7 to the left over gates of the LS158. The left over outputs are connected to the SIMM. Now all you have to do is find a 4MB or 16 MB SIMM.

That's it for now.

Mathy van Nisselroy

PS Oops, if you have a real 130XE he'll have to disable the top 64kB. This can AFAIK be done by desoldering the resistor in the CASBANK line. If you do this on the side connected to the RAMbank, you can use the now free end of the resistor to grab the CASBANK signal which we need to connect to the LS08 (see above).

PPS existing 1MB upgrades can be converted to work just like the above upgrade.

If you will go to http://www.jdr.com you can order part number
CA3086 for a whopping 55 cents and have a new one. The transistor
array is only rated for 7 volts base/emitter. I think the 1489 SIO
cable is NOT regulated well enough to keep from cooking these chips.

Ok people. pull out the bible of atari 8bit (Mapping the Atari). look
on page 106. atari basic FP routines. listed , they are SIN, COS, ATAN
(atangent) and SQR.
Mapping also lists the DE RE ATARI has them listed as well.

> the Pal models.

The 800xl does have luma. Chroma however is missing. the 600xl (pal
versions) has a monitor jack but only Video and audio is avilable.
The 130XE/800 has Video, luma,chroma and audio.

> me to some references on how to replace these chips? Thanks in advance,

If your 800xl is all socketed, replacement is easy. Simply use a small
flat blade screw driver to leaver the chip out of the socket, NOT the
socket from the board.
Take note of which end the notch on the chip is. All chips will have
the notch either on the left or at the rear end. The GTIA chip is the
lower left 40pin one numbered CO14805 for NTSC and CO14889 for PAL.
If the chip is soldered to the board, much more work is involved. One
way is to use a sharp knife and cut all the pins then clean out all
the holes and solder in a new chip.

You mean the Prosys cable or SIO2PC? SIO2PC runs on the computers 5V supply,
so it can't exceed 7V.

While back I bought up maybe 14 drives that were Atari returns because they
were selling 2 for $5. Probably 3 of them had burned out 3086's, 7 had power
supply problems with the diodes overheating and breaking the solder
connections, track zero sensor on 2, LSI chips on the others. I really
seriously doubt if any of these drives had ever seen a Prosys cable. I think
the first thing Bob Klass checks when he gets an non responsive drive is the
3086.

I just gave away 3 Prosys cables, one to Nir who hasn't had a chance to
report back yet, one to Carolynn, and one other<just drew a blank> where it
turned out one of the non responsive drives was due to the head being dirty.

In Carolynn's case, I would bet diamonds to donuts it is not the 3086. When
the 3086 goes out, it the drive just stops responding as if you had
unplugged the cable. Carolynn's drive was still bumping and grinding while
failing to read disks which means the 3086 was still working.

So, I have seen a fair number of drives where the 3086 has gone out, but so
far I have not seen one that has gone out due to a Prosys cable. Remember

the Prosys cable is a 1489 powered in all likelyhood by a single inverter of a 1489 in the PC. There just isn't enough current available to burn anything out.

You have to look at the equivalent circuit for a 1489, it is virtually impossible to burn out anything attached to one because they have on chip current limiting. Only way you could screw up is by wiring the 5V supply to ground or some other serious faux pas.

J. Picken says there are no FP routines in BASIC, BASIC uses OS
routines.
Ok. There still has to be handling of numbers in BASIC code.
But I looked a bit more at the source listing and the main FP stuff
is listed, at D800-DFFF.
So, Wilkinson's code was put in the OS ROM, I guess.

Update,

Managed to order a handful of 3086s from RS Components (easier from
them because I'm in UK) even though I failed to notice that they sold
them previously.

I will post my results when I get them through.

Thanks again.

Rob.

Other than Bob's suggestion and my tests, I don't know the 800 GTIA is
bust. I'm no expert and I have no diagnostic software for the 800, so I'm
going with the most reasonable solution. I have some diagnostics for the
1050 and 1027, but none for the 800 itself, does any exist?

Yes. Mine. It's on my web page below. The makefile is setup for SGIs, but
with some minor modifications (i.e. replace the motif libraries by lesstif
and change some options) it is easely compiled under Linux as well. Currently,
sound support is still missing as I do not own a PC (yet) and SGIs don't
support the Linux "voxware" sound system.

So long,

Hello,
afaik the 810 can read Single density (90k) only. Maybe you have one of those medium/dual density formatted DOS 2.5 disks (originally they were formatted in Single Density, but Atari was so wise, to change that to medium after a while). So try searching for any DOS 2.0s or 2.5 on a SD disk. Using a printer, well this is always depending on the printer itself and the program you want to use...

With Basic (cart from Atari or Disk from M$) simply try:
10 LPRINT "THIS IS A TEST"
20 RUN or shorter: LPRINT "THIS IS A TEST":RUN
(hoping that MS-Basic has the LPRINT command).

The problem with the printer and various programs is, that there are far to many different printers and most programs only support a few of them (some good, some bad, depending on a) the pins and graphic capability of the printer and b) the programming capability of the program author). Most times the program supports only Atari or only Epson compatible printers (and Atari had quite different printers, Epson too !!)... good luck !! Andreas Magenheimer

P.S. Also take a look at the "Atari Beginners FAQ" homepage from Bill Kendrick... (I forgot the URL, but its easy to find) and the "Atari Basic commands" homepage...

On my PAL XL machine Chicken works alright (without translator disk or
OLD OS installed!). Playing Chicken is quite funny (using a JOY-stick or
Paddle controller). Slime from Synapse needs the older OS / Translator,
Gorf from Roklan also. Andreas Magenheimer

What if Atari came out with a game or program that needed a programming
language (that was also avaiable on cartridge) ?!?
Maybe we had to put the language cart (Basic, Action, etc.) into the
first slot and the program cart into the second (or vice versa).
Afaik, only compiled games/programs were done on cart...
(maybe others - uncompiled - are impossible to put+run on cart)
Andreas Magenheimer

P.S. Aren`t there any game carts avaiable that state to put/plug in
Basic first ?!? (Or are such games only avaiable on disk+tape??)

Hello Lance,
you have Ft. Apocalypse on cart ?!? In your own inventory/collection or do you also sell it ?!? I merely have it on a disk (originally with 132 SD sectors and old OS only, but I found a patched copy with 135 SD sectors, that also worked with XL/XE so I updated the original disk with that copy...) Andreas Magenheimer

P.S.: Any patched "Beta Lyrae" or "Bandits" flying around, that do not need the Translator / Old OS ?!?

2889. WAP and Atari 8 Bit ??

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-11 00:00:00 UTC
From: Andreas Magenheimer <magea000@mail.uni-mainz.de>

Hello folks,
I do not have a "Handy" nor do I know the secrets that stand behind WAP. But this allows the Handy to get in (small and slow) contact with internet services. The Baudrate is 9600 Bps... Hey, my 8Bit Atari can do that Baudrate, so what hardware (and software) would one need to use WAP with his little Atari ?!? Graphics should be the smallest problem, since WAP uses only LCD graphics on a Handy. Atari should be able to do that in any graphics mode...

What hardware and software do we need to use WAP and is it possible to use WAP with the little Atari ?!? (Even though WAP will not last for a long time, since there already is a much better, faster and newer Handy service...) Andreas Magenheimer

I have already aquired a copy from a big bunch of 8-bit disks I purchased a few days ago. No need for one now, mine works perfectly.

dear andreas,
yup i got ft. apocalypse on cart in my collection.
i carried it once back in the early 80,s,but when i went to reorder,
synapes was gone(thank jack for that one):(
i never kept one for myself, bummer.
i never saw it again till a fellow advertised it on this news group for
sale.
the price was steep,but i still grabed it.
then i found 2 left in my warehouse still new,you cannot win.
but they are 400/800 only,i have not tried the translator cart yet.
but i have it also on floppy new in the box that requires no translator.
thanks,
lance

FamilyNet HQ: Telnet:\\www.family-bbs.net

Just FYI, did many of you realize that there is a newsletter that is
published in New York that is sent out every few months?

It is the coolest experience. You get a floppy in the mail that you can
pop in your Atari floppy drive and load on your 8-bit machine.

On the floppy are not only club notes and various other user group
articles, but humorous articles, informative articles, and featured programs.
The disks are in enhanced density and double sided.

For more information, you can reply to me
or Ron Fetzer, Vice President of OHAUG at:

fcats5@aol.com

This may be OHAUG's last year, so enjoy this experience while it's here!

OHAUG member,

Doctor Clu

PS: Tell 'em I sent you. ;)

I had an 800XL and a1050 drive back in the mid-80's. I found both on Ebay
and picked them up. I am looking at this and can't remember how to get
started. I need the OS and any manuals would be good. Can someone help
with this.

Thanks,
Tierlen

2901. MIO Help

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-11 00:00:00 UTC
From: "Brian J. Furbee" <bfurbee@wt.net>
Message-ID: <391afddb_1@data.wt.net>
Source record: 44868

Hello All,

I am currently trying to get a Conner CP3040 SCSI Hard Drive (40 MB) working with a 1 Meg MIO on my 800XL.

I am using SpartaDOS 3.2g and have successfully (as far as I can tell ;) physically formatted the drive using HDFMTPH9.COM. It reports 82080 sectors available (I'm losing half the drive capacity because of it using 512 byte sectors and the 8-bit only using 256 byte sectors).

I then setup my partitions in the MIO utility - Drive 4 starts at sector 1 and ends at 16385 which yields a 4MB partition. Drive 5 starts at 16386 and ends at 65535 which yields a 16MB partition.

When I go to use the HFMTDIR program (ICD - 5/1986 Version) and select the drive to init it reports "Error writing sector".

The drive in question has been pulled from an old Mac where I formatted and tested it, so I know the drive works.

Any ideas?

Thanks,
-Brian

I tried something similar with an 80mb drive from a Mac and my 256k MIO.
AFAIK, you can't handle 512-byte sector HDDs with a MIO--you need a
BlackBox or a software driver to bypass the MIO ROM.

I got started looking at a driver to handle the larger sectors using the
MIO's hardware but lost everything (including the MIO ROM source sent to
me by a kind soul) when my PC HDD took a dive. Since getting back up and
running, I just haven't bothered as SIO2PC fills my needs adequately and
I use the MIO strictly for RAMdisk and printer interface.

BTW, you also need to find a way to disable parity on the Mac HDD
(assuming you beat the 512-byte sector problem).

The difference is that Monkey Wrench occupies 8k memory at all times; SDX
does bank switching to hide or at least reduce its memory footprint.

What I al;ways wanted to see was Action plugged into Diamond GOS plugged
into SDX plugged into RTime8 all on a 256K 800xl!

For the XF, 9 times out of 10 it is the solder connecting the SIO plug has
broken loose. Good luck fixing the XFs anyway, the PC board is so cheap it
is like trying to solder on a saltine.

People pretty much have a tendancy to do things like super gluing their SIO
cables to their XF drives or directly soldering them to the PC board.

Tell us what the 1050 is doing and we may be able to guess.

VR2 IIRC, in the back left hand side. Only for 1050, the XFs are set to run
at 300 RPM.

Yes, I knew that, looked it up in a pamphlet that came with my 800, I have never seen one, though, just have it on disk.

Maybe the drive has been 'offline' for several years. I remember having
a stack of SCSI disks at the office working day and night for over 10 years.
After a _major_ powerdown they wouldn't work anymore. We had to shake and
shake them for a couple of minutes and almost all of them started to work
again. We opened up two of them and gave them a 'manual spin' and magically
they worked again. Six months later they died for good...

Does anybody know if there are 400/800 games that don't work with a
translator on a 600/800XL? (for example, the game does an 'accidental' (sp?)
write to the OS region)

ok answer me this. How can you boot froma disk when a game cart is
inserted??
Unless you push the cart in while the computer is on?

2923. rize with me... MP3 Translator

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-12 00:00:00 UTC
From: Greg Goodwin <Greg.Goodwinp0.f2.n8.z8@fmlynet.org>
Message-ID: <0002.391c512d@fmlynet.org>
Source record: 44890

FamilyNet HQ: Telnet:\\www.family-bbs.net

Hello, just had an interesting idea that I wanted to share for our versatile and fun computer system.

I was introduced to some MP3 files that are Atari in theme at:

http://artists.mp3s.com/artists/68/stasischamber.html

I got to thinking what a shame it is to have to resort to a PC to listen to MP3's with an Atari theme. Just's just not right! (quoting Guy from Galaxy Quest)

So I was thinking of the following scenario:

A person finds a MP3 file, much like...

E.T. Highway Alternative General
Lo Fi: Play (28.8k modems or faster) Hi Fi: Play (high-speed connections) Download (3.6 MB) Song Story Email Song Add to My.MP3.com Description: The Route 66 of a new century. New Mexico - be proud! CD: V 1.0 Credits: Stasis Chamber

...takes the file, and compresses it with that really cool mega compression that could take the 3.6 MB file down to a 38k file. :) Then take the file and download it to the Atari 8. ;)

Once there it could be unzipped with Tom Hunt's unzip program onto a Atari8 hard drive, and then...

.. well I was going to suggest taking it and translating the signal, saving it to the 1010 recorder, but...

Taking the file and having a program translate the MP3 to a digital or wav file. From that point, you could play the translated file on the Atari8 with buffering involved. Or somehow save it to tape at that point.

Is that Atari8 tape drive capible of doing audio sound records from the computer?

Anyway, just a scenario of how I think an 64K Atari computer would handle a MP3. What do you guys and gals think?

james,
the translator cart,or disk is booted first,on the disk you turn off the drive, but leave the computer on,then insert the cart,on the translator cart, you remove the cart with the computer on! yes it does work,no it will not hurt your computer,then install the 400/800 only cart,and if its within the parameters of the translator,it will boot in seconds or less.
i use the translator cart to play gorf all of the time,i love the game,and i got sick of having to use the slow disk based translator,or using another computer to do this,so i thought why can we not moderize this utility.
the cart port on the atari8 was,and is still vastly under utilized,thanks,
lance

Well after much input from various people (thanks all!) and a little digging it looks like I'm going to have to go in search of an MFM drive and controller.

Would it be possibly to modify the SCSI<->MFM controller in the Atari SH204 (ST) Hard Drive <bypassing the ACSI interface to the SCSI<->MFM controller> for use on an 8-bit? It has a Tandon TM262 MFM Hard Drive (20 Mb formatted capacity). Anyone want to venture this hack?

Thanks for the help!

If you're serious about making your Atari-8 do anything useful, switch to
MYDOS 4.53 for starters. When you get really serious, start using
SpartaDOS 3.x. FWIW, SmartDOS is just DOS 2.0 with a better DUP.SYS and
the best thing you can get from DOS 2.5 is its copy 3->2 utility to
convert any DOS 3 files to DOS 2 format.

I think the MP3's are already compressed down about as much as they can be compressed. What could be done would be to convert an MP3 to .WAV format. Then tweek the wave file's parameters until you get the file size down to an acceptable size. Then you could use the "Sound Utility" program I made to play it back on the 8-bit. It allows you to play wave files up to 1088k with some memory upgrades.

Also, I think the way you get an audio track on a Atari 8-bit program cassette tape is to record the audio on just one of the two stereo tracks. I forget which track you have to use.

You missed one.

Superdos 5.1. Dos 2 compatiable and able to use the xf551 at high
speed.
Also has dos 3 to 2 conversion util. use axalon or xl type ram disks.
Dup loades instantly.

Source record: 44701

I was talking about the 'equivalent' 1489 cable to the 1050_2_PC cable. I wasn't talking about your pile of junk drives or Bob Klass (???!). There is more than just a couple of messages in this base that go along the lines of "HELP! I used my 1050_2_PC cable to make dozens of .ATR disks and everything worked fine. Then I built a 1489 cable, made four disks and my drive is now dead. It won't work even with my Atari anymore. What did I burn up??"
Those posts inspired me to look up the schematic for this '1489 cable'. I found a 5.1 volt Zener diode without a load resistor that allows the Zener to work in the first place. Without the load, which forces the Zener to operate in its 'Zener knee' curve, the Zener WILL NOT regulate the voltage. I suspect that if one were to add the load resistor, the circuit would quit working because it is powered only by the data output voltage signals of the PC (another questionable aspect of this circuit) and there would not be enough power available to run the 1489, send data to the 1050, AND keep the Zener on its rated voltage/current curve.
If I'm right about the 1489 circuit then we ought to see twice as many 'dead drive' posts from the C1489 circuit as it is using CMOS transistors which will allow for even more voltage to be available to fry the Atari drives.
Since there is 10 volts or so comming out of the PC serial port, there is more than enough voltage to destroy the base/emitter junctions of the 3086 despite current limiting. We are talking voltage, NOT current. We are not talking about enough power to cause a fire or even smoke either. Just enough voltage to eventually put the hurt on those 3086s (nano-second spikes). And not always either, each PC will put out what it does. There is no way I know of to say this set up will work with that PC and that one won't.

I'm sure there are happy users of this cable. But to those who have killed their drives with it, I would say - don't use that cable no more.

Not sure about the Indus problem. One of my biggest complaints about
SuperDOS is that it maintains compatibility with the really lame DOS 2.5
enhanced density format. Any format that hides files from other DOS with
which it is "supposed" to be compatible is beyond "lame"--it's bloody
stupid.

Look, I told you to look at the equivalent circuit for the 1489 chip which you apparently still haven't done.

Educate yourself a little bit instead of being hysterical and I will conduct a discussion with you because you really do not know what you are talking about.

Now you are just going to look stupid. I mentioned in several posts that the 1489 has current limiting on chip. The outputs of a 1489 are not push pull, they are passive pullups with a 2k resistor. The passive pull ups means the maximum drive you can put out is <7V/4000 or less then 2 mamp. The base of a 3086 can handle 5 times that current w/o a problem.

There are no miracle PC power supplies that put out +-25V for RS232, they all use +-12V which gets dropped to under 7V by the zener in the Prosys cable.

I did the trouble shooting with the first cable Carolynn put together and the failure had nothing to do with the design.

If you actually read the discussion, you would find out that one user found out he had a dirty head on one drive and sent the other to Bob Klass for debugging. Carolynn's drive still responded to the Prosys cable which means it can not have a burned out 3086. I posted that fact and you chose to ignore it. You are worse then ignorant, you are prejudiced against facts that don't fit your theory.

I also left a Prosys cable hooked up in a burn test from a friday afternoon until monday doing a burn in test, no problem.

Why is it every pseudo engineer can pull facts like ~"exceeding 7V" out of his ass and expect people to take him seriously, but they can't crack open a data book and actually learn something?

Don't even respond to this until you start coming up with some factual data. Put a dozen cables together and tell us how many exceed 7V output. Offer to fix everyones cable or drives like Bob and I do, and find why they failed to operate.

Personally, I'd take 3.0 over 2.5 any day of the week, but given that
Sparta and MyDOS are available for the taking, there's no reason to use
either.

Yes it does.
The indus high speed works almost identically to the XF high speed.
the only difference is the speed the sector data is received/sent.
The command frame is sent at 19200 baud. the xf sends/recieves the
sector data at 38400 (approx) baud and the indus send/recieves at
78000 baud (approx). This is where superdos falls over. I have changed
superdos to use the indus instead of the xf and it worked fine. A
simple matter of changeing the speed byte from $10 to $6.
of course, everyone knows the indus must be programmed before its high
speed works.

At the time, it was and still is the default standard because it was
done by atari. Why atari made enhanced density is only known to them.
We simply had to follow and improve. Atari tried to make improvments
(remember dos 3) but failed. (what ever happened to dos XE) The masses
wanted compatiabilty.
So how do you get dos 2 to use more sectors with out modifying it and
is still usable on the 810?
Wheather you think it is stupid or not is beside the point. It is out
there and we must work with it. How many unmodifyed 1050's are still
out there any way?
Superdos is ment to be a direct replacement for dos 2.5. The bonus is
it can also use double sided double density of the XF at High speed.

Rhetorical? Looking at prices, a 2nd 6810 or even substituting a static ram
with more capacity I kind of think that wasn't the problem. Figure 6507 has
8k of address space, they could have easily made it a 2k static RAM, 4 K
existing ROM, and still had more then enough room for existing hardware
chips like the RIOT. Thinking about it, they may not have needed all the
functions of the RIOT if they had a 2k ram. It would have been cheaper which
was right on with Atari's thinking at the time.

IMO, they probably deliberately put a limited amount of ram in the drive
because Happy drives were already out. If they added what would be a normal
and obvious RAM chip to the drive, all that would have been necessary is a
new commands like "Load RAM with user program and jump to it". All that
would have been necessary is to come out with a new 4k ROM that added this
command, and 90% of the existing software protection would have been
rendered useless.

For that matter, existing US Doubler drives with their 256 byte sector
handling ram could probably be converted to 128 byte only sectors with some
form of copy protection circumventing. i.e. If sector being read is Y,
return 2793<7>status equivalent to X disk controller error, else hand off to
standard routine.

Almost all of them if my purchases are to representitive. In the newsgroup,
there are few of us w/o a modified drive, but I am still under the
impression that Atari probably sold 500,000 1050s.

A couple of POKEs into DOS and then write DOS and reboot will allow DOS 2.0 (and DOSXL) to access 943 sectors (3 boot + 1 VTOC + 8 directory + 931 free). The disks can easily be formatted using MYDOS and XIO254. Essentially, all you're doing is telling DOS 2.0 to use the whole VTOC sector for a bit map. Bill Wilkinson published the modification years ago in Compute! The nicest part of the modification is that it is fully compatible with MYDOS, TopDOS, PaperClip, and SynFile. If you _must_ use enhanced density, that's the best way to do it short of switching to MYDOS or Sparta.

No matter what DOS you employ, you're not going to be able to use enhanced density disks with an 810 so, if you want compatibility, you're back to single density in any case and might as well use a decent DOS.

> Wheather you think it is stupid or not is beside the point.

The fact that the DOS uses a very stupid format which hides files from other DOS is certainly not beside the point; it is an open invitation to lost files and trashed disks. The other fact, that the second VTOC is up in sector 1024 thereby slowing all disk access while the read/write head grinds across the tracks is also to the point.

> It is out there and we must work with it.

Why? Both MYDOS and Sparta can read the DOS 2.5 format though you can't write to the enhanced density sectors.

> Superdos is ment to be a direct replacement for dos 2.5.

A direct replacement for a kludge is another kludge.

Hi

I had an atari way back - and would dearly love to play the game 'Leaper' or is it 'Leapster' again. You played a little guy jumping up levels to light the word 'Leaper' and it had the 'Popcorn' theme playing in the background.

Does anybody have this as a Rom and an easy emulator to play it on ??

Luke

For the EXE file, I've posted it in alt.binaries.comp.atari8bit. If
your provider doesn't carry that newsgroup, E-Mail me (remove the
diespamdie!!! from my address) and I can send it to you there.

For the emulator, check www.vintagegaming.com, www.classicgaming.com,
for Atari800Win 2.5c; this is the latest version of one of the best
8-bit emulators for the Windows platform; very robust, extremely
compatible, and fast enough to be usable on a P166 or greater. Its
DOS counterpart (atari800) is similar, but with a DOS flavour, and
it's rather faster for lower spec machines.

Or, again, you can E-Mail me and I can hook you up with everything you
need to get started (DOS disks, OS ROMs, emulator, etc.).

never seen that one. Have however seen one in antic that madifyed dos
2 a lot more and made it incompatiable with everything else.

> No matter what DOS you employ, you're not going to be able to use

I have never had such problems.
Dos 2.5 is an upgrade of Dos 2. Can you remember the change from 800
os to the XL one? I can. many people brought up compatiability issues
etc

> is up in sector 1024 thereby slowing all disk access while the read/write
> head grinds across the tracks is also to the point.

I guess drive heads aren't ment to step very far then.
A fact I didn't know.

>
> > It is out there and we must work with it.
>
> Why? Both MYDOS and Sparta can read the DOS 2.5 format though you can't

Although Atari is no longer around, Dos 2.5 is still the standard. It
should be dos XE (hands up any one that uses it) These days with
sparta and mydos free, the choice is there to use any of them, so dos
2.5 has faded into the background some what, but it is still there.

>
> > Superdos is ment to be a direct replacement for dos 2.5.
>
> A direct replacement for a kludge is another kludge.

You must remember. at the time it was written, it was the best one
around. It was written before the BB was ever heard of and the only
drives around were 810, 1050 and compatiable. 5.1 was an update of 4.3
to take advantage of the XF551.
4.3 could support double density in combation with a local hardware
upgrade called Supermax.
You should ask for the instructions to see what it could do. Aux sys
(part of superdos) has a boot menu loader, copy from dos 3 and a few
other goodies.
Another file included could do a similar thing to the boot menu, but
with basic programs. Big deal at the time, because nothing else could
do it all in one packadge.

6810s were relatively expensive for a 128 byte RAM. It's not that a 2k RAM
would have been cheap, just that they were about equivalent in price to a
6810.
>

Those were mostly post 1050 release and a response to Happy and Duplicator. IIRC, 1050s didn't come out until 83-84 and most of the software I looked at from that time period or earlier only had a bad sector or three. There are some really nice titles after that time period that used the fancy copy protection, but the early stuff like the Ultimas relied on a single bad sector for copy protection.

But even something like a fuzzy sector, all that is done is read the same sector several times and make sure the data comes out different on each read. It would be trivial to have a program that returns different data on every read of a sector, just put a random value in the last byte everytime the sector is read.

3.0 is okay if you're doing your own stuff, but 2.5 seems to be the
most widespread and compatible. But yeah, these days I'm with MyDOS
4.53 and not looking back.

: (ST) Hard Drive <bypassing the ACSI interface to the SCSI<->MFM controller>
: for use on an 8-bit? It has a Tandon TM262 MFM Hard Drive (20 Mb formatted
: capacity). Anyone want to venture this hack?

: Thanks for the help!
: -Brian

The Scsi - MFM controller in an Atari ST (shoebox) SH204 hard disk is an Adaptec 4000a.....to use it with the 8 bit, unplug the adaptec from the Atari ST Hard disk interface and plug it in direct to the Blac Box or MIO.....in fact, you can sub in a bigger....say 40 meg MFM drive where the 20 meg one is....

I use a 40 meg MFM drive, with an Adaptec in an SH204 case that has had the ST interface removed....I added a long Scsi cable, and ran it through the hole created when I took the ST DMA interface out....

So, the point is.....don't touch the Adaptec! It works as-is with the MIO....no hack required!

If you want to maintain true compatibility for swapping disks there is
only one format to use: Atari DOS 2.0s. Every DOS I've ever seen for
the A8 can either read that format or comes with a conversion utility
to access it.

With MYDOS and possibly some others (TopDOS?), you must also ensure that
you don't use any quick format option with a 1050 drive if you want to
be certain the disk will be usable on an 810; a "quick format" will quite
happily lay out a 720 sector DOS format on a disk that is physically
formatted in enhanced density.

BTW if anyone picks up a pile of old hard-sectored disks (18 timing holes
instead of one), they are usable with a 1050 but not with a XF551 or a
PC 360K drive so don't pass them around. I think this type of disk was
used with some or all of the Apple 8's.

Well, my trusy Tandy Co Co III bit the dust tonight after many years of service. I have a bunch of games I can no longer play that I have for trade. These include:

ROM PAKS:

Rampage
Rad Warrior
Downland
Castle of Tharogad
Dungeons of Dagorath
Robocop
GFL Championship Football II
Thexter
Super Pitfall
Mazing World Of Malcolm Mortar
Shanghai
Tetris
Predator
Springster

I'd be willing to trade for any of the following Atari titles:

Atari XE:
Airball
Into The Eagle's Nest
Thunderfox
Crossbow
Diamond GOS
Gato
Crystal Castles
Karateka
Summer Games
Montezuma's Revenge

Atari 7800:
Kung Fu Master
Title Match Wrestling
Tomcat: The F-14 fighter simulator

Atari Jaguar
Trevur McFurr in the Crescant Galaxy
I-War
Pinball Fantasies
Cannon Fodder

If you're interested in working out a trade, please respond via email.
Thanks,

Mark

Hi AtariGirl

Are you a real chick, 8~) where in the world are you?.

>I am looking for the following items:

>810 Disk Drive
>1050 Disk Drive
>850 Interface

>....and some other items

Maybe its time to clear out my loft, ive got:

1 * 600XL
1 * 800XL (256K)
1 * 130XE (320K)

2 * 1050 'Happy' converts
1 * 1050 vanilla
1 * 810
1 * 850
Some other Atari to printer convertor cable (forget make).

Spartados cart
R-Time 8 cart
Ass-Ed cart
Spartados disk and toolkits

Various other utils/carts.

I also have a custom made speech synthesiser that i used to 'Print' to via the RS 232 port, so's my XE would speak to me.

Non serious offers will be ignored.

The Antic one was actually only WRITE incompatible because of shifting the VTOC from the 2.0 standard to give you 976 usable sectors; you could READ fine if your drive supported the format. We used it several months before Compute! published Bill's mod.

-Ron

I don't have a solution but I admire the problem.

2972. FS: Printer Interface

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-15 00:00:00 UTC
From: "John K. Picken" <yg473@victoria.tc.ca>
Message-ID: <Pine.GSO.3.95.iB1.0.1000515001859.25477A-100000@vtn1>
Source record: 44739

Going through my box of Atari odds and ends, I came across a
printer interface with modifications done by a professional computer
technician. This is the standard Graphix AT interface with eight DIP
switches and a serial port attachment on a five foot cable.

The modifications are:

a. a three-foot SIO cable was added to the original SIO plug so that
the interface does not terminate the SIO daisy chain. As it's wired,
the interface is actually in parallel with a standard SIO cable which
can be plugged into a disk drive, etc.

b. a two-foot ribbon cable terminating in a Centronics male plug is
wired to the interface's edge-card connector so that the interface
does not have to be stuck directly into the printer (where it gets
in the way of tractor feed paper).

c. a second, four-foot ribbon cable with a Centronics female plug
is plugged into the cable from the interface. This cable has two male
Centronics plugs, one about four inches from the female plug and the
other at the opposite end. A toggle switch on a three-foot cord is
attached to the first male plug to allow switching data between two
different printers.

With this setup, you can handle two printers from the one interface.
(The original owner successfully used it with a Panasonic 9-pin and
an HP DeskJet 500.)

I have absolutely no use for this as I do all my printing via SIO2PC
and/or the MIO so I am open to reasonable offers if someone can use it.

I guesstimate that surface mail to anywhere in Canada or the USA
would run about U$10.

I recommend you use the the Antic Sampling Processor (ASP) instead.
It should run using a microphone built with the "Talk is Cheap"
schematics. The big advantage is that ASP is written in assembly
language and you can digitize 40K clips.

You can get it from the Digital Antic Project at:

http://www.atarimagazines.com/software/software.html

Look under Feb / Mar 1990 (all the way at the bottom). You can also
download the 6502 source so you all can see how bad my assembly was
way back then ;)

sup8pdct@mail.cth.com.au writes:

>> A couple of POKEs into DOS and then write DOS and reboot will allow DOS
>> 2.0 (and DOSXL) to access 943 sectors (3 boot + 1 VTOC + 8 directory
>> + 931 free). The disks can easily be formatted using MYDOS and XIO254.

The 931 sectors modification has really been used here for quite a while. (-;
Then someone came up with a hack that improved this further to 963 sectors,
but for the price of loosing VTOC compatibility to Dos 2.0S by shifting the
bits in the VTOC. Then I came up with a modification of the modification which
made this compatible again. The 931 version still left - IIRC - 6 bytes in the
VTOC unused. With some trickery, these bits could be made use of for
additional sectors, but without changing the meaning of the remaining bits in
the VTOC.

The remaining sectors on the 963 formatted disk are not unused in my "private
DOS" though, they contain the "dos.sys" image which no longer takes up "disk
space" then. This really made all disks boot-able for no price whatsoever,
leaving more disk space for the user.

To complete this little dos history, I finally managed to move all the disk
buffers and the FMS to the RAM behind the ROM, giving a DOS that ate as much
as 163 bytes of Basic RAM. (-; A "plane" version of the Dos was also available
for TurboBasic. Oh well, old times....

Concerning the other Dos'es: Dos 2.5 access mode was designed to be 100%
fool proof, therefore files beyond the 720 sectors limit are unaccessible. This
is a wise decision as far as data security is concerned. I personally
considered this as a pain because I pretty much knew what I was doing, but I
can see the point and maybe I would have done something similar today. From
the point of software security, it's the best thing to do.

Dos 3 isn't as bad as everybody thinks. The FMS is much more canonical than the
Dos 2.0S FMS, a much more canonical POINT and NOTE and a very cleaned directory
approach. It is in many cases similar to the MS-DOS "FAT". I personally would
have used Dos 3 and wouldn't have cared about compatibility if just Atari
hadn't made the design fault to group sectors in blocks of eight, which is
just a waste of storage capacity in the already light-weighted 1050 capacity.

Several years ago I played with a "Dos 4" approach which worked in many cases
similar to Dos 3 and to the Unix "ext" system, allowing sub-directories and
links, and using the concept of "everything is a file", even directories
and the root directory was a file very much like everything else. The Dos
was never finished, though. The basic FMS operations should be present
already, and I might be able to dig out the remaining sources if anyone is
interested in playing around with it.

>> Essentially, all you're doing is telling DOS 2.0 to use the whole VTOC
>> sector for a bit map.

Except for 6 bytes... (-;

>>
>> The fact that the DOS uses a very stupid format which hides files from
>> other DOS is certainly not beside the point; it is an open invitation
>> to lost files and trashed disks.

The Dos 2.5 was written in a way that exactly did not allow trashing, even
if written to by Dos 2.0S. This was the point of leaving those files unacces-
sible and splitting the Dos 2.5 VTOC in the halve.

> The other fact, that the second VTOC

>os to the XL one? I can. many people brought up compatiability issues
>etc

>> is up in sector 1024 thereby slowing all disk access while the read/write
>> head grinds across the tracks is also to the point.

This is one of the bad points about Dos 2.5 and the reason why I never used it
personally, except for the game disks where capacity was an issue, and not
write speed.

>I guess drive heads aren't ment to step very far then.

Well, they are, but it's just slow. Every "open for write" requires a read
of the VTOC, a WRITE of the VTOC to mark it busy, then write the file, then
write the VTOC back. These are 3 accesses, and the head is scratching over
the disk surface twice for each access.

>A fact I didn't know.

Wally-

Are you sure it is the drive and not your disk? My 810 does that and usualy it is from a bad disk. Just a suggestion. Do you have another drive that works? If you do, you could just test the disk. I know, you are probably more experienced as far as ATR matters go than I am, but that is the glitch with mine. Let me know.

BTW, I can see why your techinican doesn't want to fix the drive, would cost more to repair than to buy another one (used @ Goodwill or Salvation Army) but it gets frustrating when the drive does not work (esp. when you want to do something). My 810 just recently ressurected from the dead after being out of use for 15 years, went offline, and now I don't know how I lived without it. I have discovered the pleasures of playing Chicken, Bruce Lee, and so many other great games that I thought were "boring" by thier names. Well, ugh, I have rambled on.....

Well there are some programs, but not so many it seems. Here in Germany
the american soldiers are more and more leaving their bases and
headquarters, thus there are also many US schools and kindergardens
closing now. I was able to get some Atari material from these schools
and kindergardens - and yes I found some older Atari programs that did
not work on XL or XE machines, even with the translator installed...
most of these disks were Basic programs, they needed Basic Revision A on
cart !! After I installed the old 800 Basic cart into my XL computer,
they worked ok...
greetings - Andreas Magenheimer

>
> Jessica

With some translators booting from a cart is very difficult, first boot the translator, then do a reboot (with Select or Option pressed to install the older OS) and nearly at the same time insert the cart into the slot. This has to be very fast (half a second or so), otherwise the XL or XE computer will crash. With the "Ultra translator XL" its a lot easier: press two console keys (Start+Option I think) and the translator will immediately go into attract mode. This means the screen gets one (random) color (sometimes green, sometimes yellow, etc.) and waits for you... installing the cart. You have more time to install the cart now, but as soon as you do it install it completely in one process...
Well, this is much easier and works quite more often, than with other translators (most times I used other translators, the computer did crash). greetings - Andreas Magenheimer

P.S.: There is of course always the option to install the 800 OS (or a copy of it) into your XL or XE machine as a second OS, you can simply switch to (or using a multi-functional OS from CSS and others, that have options to switch between original XL/XE OS, 800 OS and Ultra-Speed OS)...

That sounds very funny... (or how Atari computers can enhance your state of humor !) By the way: where can I find that compressor that compresses the (already 1:10 compressed) MP3 files once more a dozen of times, so that we have files, small enough for using and playing on our little Atari ?!? Any clues for writing a sound and/or video compressor, that compresses data 1:1000 (1 Megabyte gets on kilobyte) or 1:1million (1 gigabyte gets 1 kilobyte), so we can hear CD sounds and watch DVD videos on our 64k Atari system ... ???
Ha, ha ha !!!

With the XF551 there is no need to adjust the drive speed, it always runs with 300RpM (sometimes 301 or 302 RPM). The 1050 has the adjustor somewhere near the drive cables on the left rear side (this small blue thing with a screw!). About the problem with your booting drives I do not have a solution here, but I do hope you did not connect them all at once to your Atari...

(The little Atari does not like to attach more than one drive set up as drive 1. if you connected them all by mistake as drive 1, try to use different drive numbers/different set ups or switches for the drives. Or use one drive after another set up as drive 1, since the Atari only boots up from drive 1, unless you have a third party or patched OS)
thats all for now - greets - Andreas

2982. Ft. Apocalypse (Synapse)

[snip]
Hello Lance,
I have that Ft. Apocalypse disk already. Still searching for the cart (I love carts!), even though its a 800 only cart. What do you want for it ?? greetings - Andreas

P.S. Synapse went into cooperation with Broderbund I heard. Later they were completely taken over from them. Unfortunately Broderbund did not dig out all Synapse games again...(oh, how I had loved to see Capture the Flag from Synapse appear again!).
That Tramiel thing had to do with SYNapse - utility/application programs like Syncalc and others... at this time they had already been in cooperation with Broderbund... maybe others know more about that...(here in germany we only know rumours about synapse!)

2983. Re: 1MB Upgrade. Ruff "scetch". For the impatient. Preliminary version. Solder jockies only.

Message-ID: <39200A79.A83EEC1@mail.uni-mainz.de>
Source record: 44750

[snip]

Hello Mathy,
sorry - I had to snip your information here. Is it also possible to
install a switch to choose between a) 64k memory (64k RAM), b) 128k
memory (64k RAM + 64kRD) and c) 1088k memory (64kRAM + 1024k RD) ??
Why - simply to test and see whether a certain program needs 64k memory
or 128k memory or more... (if you always have bigger memory you will not
notice if a program still works with 64k - and thats when XE programs
get published in magazines like ABBUC and some hundred users complain
about that, since they cannot use them...)

greetings - Andreas Magenheimer

Hello,
there is one or more diagnostic test (once called Super Salt diagnostic
test cartridge) avaiable for the 800. The original cart is something
rare and expensive (try Best Electronics for that collector item), but
there also exist some file versions of diagnostic tests. Like a) pirate
copy of that Super Salt cart and b) SI (system info) from Poland and c)
some files from Antic or Analog (which I already forgot). Maybe you can
find them anywhere in the 8bit archives (Umich, CTH, Taquart, Tight,
Fornax, CTH mirrors, Atariworld and other archives). Good luck! -
Andreas

2985. Re: HELP - 800XL (DOS preferance)

Newsgroup: comp.sys.atari.8bit

Message-ID: <39201893.EB78DFF8@mail.uni-mainz.de>
Source record: 44752

[snip]

One thing, the americans might not know is, that DOS 2.5 was one of the most prefered DOS versions here in Europe, especially in Germany. There are and were many games, demos and tools that were written with it (in mind) and even many programs that were witten for DOS 2.5 only. These programs used illegal jumps directly into the DOS or they set the memlo of it as a standard. Both things are hard to update and patch nowadays for other DOS versions, that have a higher memlo or just won`t match these illegal jumps...

This is something for the hackers and patchers, but alas, they only try to pirate commercial stuff (i.e. put away the copy protection).
Normal guys like me (that do not know how to hack/crack or patch a certain program) have to live with these restrictions, which means, you can have a 1,44Mb floppy drive and a 16MB harddisk partition, but there are still programs that will merely work with a) 128 bytes per Sector or b) a certain DOS version (DOS 2.5 only, SpartaDOS only, etc.).

By the way, here in Germany several quite famous DOS 2.5 compatible DOS versions like Bibo-DOS, Turbo-DOS and others were done in the meantime (since no-one could afford importing Sparta-DOS from America, when it wasn`t Shareware!). So, ask anyone here in Germany which Atari DOS he uses and you will mostly get answers like DOS 2.5 or compatibles. Only a few users have and use harddisks, 360k-1440k Floppies, a BBS, etc. and thus use MyDOS or SpartaDOS. For medium/dual density DOS 2.5 always had been and still is a standard, since no third party floppy drives were avaiable here and floppy enhancements like Speedy and Turbo still used DOS 2.5 compatible DOS versions (like the mentioned Bibo and Turbo-DOS).

And finally and lastly, bulletin board services and data transport via telephone was not allowed by the german post (Deutsche Bundespost), although I was living in western germany !! Thats why most german Atari users do not know (me included) how to do that. And one final question: MyDOS does not use sector links with Medium/Dual density, how does it refer to the sectors then ??
With sector links, there is always a way of undeleting files (if they are not already overwritten) - can you undelete files with MyDOS medium/dual density and double sided MyDOS densities, or are they lost forever ??

About Sparta-DOS: In the years, when it had not been shareware, it was very expensive and only a few vendors did import it to west-Germany. But it also used a completely different format (like DOS 3 and DOS 4 used different formats) which had already failed, since most users continued with DOS 2 format. Next, it supported bigger drives and harddisks, which

were not avaiable in Germany and it did support Time and Date stamping via the R-Time 8, which also was (almost) not avaiable in Germany. And finally it did not work with Turbo-Basic XL (without any patches), which was a quite famous (german produced) Basic language. Why should anyone have used it then ??

Nowadays, things are different. We get access to big floppy drives, harddisks and even BBS, if we like. There are several Turbo Basic patches avaiable, even one for Sparta-DOS, you can rebuild the R-Time 8 or create your very own clock, etc. But alas, you still have to bother about these programs that were programmed in a special (mostly "illegal") way and for special formats (128 Bytes per sector) or DOS versions. There is no time to patch hundreds of files, so DOS 2.5 just lives on... Andreas Magenheimer

P.S. This merely shows my (german) point of view. Yours will surely differ...

Hi,

One in the same now, kinda sad. Though Broderbund still makes software, it is still very Synatec (like the annoyances of Norton Antivirus, though it is powerful when one does have a virus).

-Jessica-
16 and an Atari addict. Long live the Fuji!

>P.S. Synapse went into cooperation with Broderbund I heard. Later they

>Not compatible w/the 810, or the
>disk is just dead. Who the heck knows?

The hard sector timing holes have no effect on the 810; trouble might be medium
or double density or unformatted or dead or that 'who the heck knows' thing?

-Ron

I don't have a solution but I admire the problem.

>"w_a_lang" w_a_lang@willinet.net remarks:

>It makes the whoosing sound like it is running, but
>all I get is a "BOOT ERROR" message scrolling down my screen.

The first two things I would check is the drive belt and the track zero sensor (both available from Best http://www.best-electronics-ca.com/).

Remove the six screws on the bottom; tilt up the back of the case and ease off the top and front face plate. You can operate it (carefully) in this open condition to verify that the disk actually spins when the motor runs... Also notice if the head retracts toward the back of the drive at power up and then attempt to boot a disk after manually (& gently !) positioning the head over (actually under) that first outside track to see if it starts to read - listen for the beeps.

-Ron

I don't have a solution but I admire the problem.

> refer to the sectors then ??

Atari DOS link bytes consist of six bits for the file number (position
in the directory 0-63) and ten bits for the next sector address (0-1023).
MYDOS format uses all sixteen bits for the sector address (0-65535) and
does not use file numbers so files can obviously still be undeleted.
Besides allowing for larger sector numbers, this format means you can
sort or otherwise rearrange the order of files in the directory without
having to rewrite all the "in use" sectors to update the file numbers.

Mine did the same thing. I believe it would need a new driving
mechanism, but I would just send it out and get it repaired. Try the

Hi,

Do you have any more info on the DOS 3 disk structure? It is
something that I've always been interested in, but never had the time
to look into in much detail. I've always thought too that DOS 3
wasn't quite as bad as everyone says, and would have worked much
better with a ramdisk to store all the DOS files on instead of having
to switch disks all the time on a 1 drive system.

Source record: 44772

You may want to try ANADISK and Preston's program DEANA since Ataris data
are written with inversed data. Sometimes you get lucky and have a
controller that will handle Atari disks. From there you should be able to
load the image into the emulator Xformer or one of the others that will take
straight disk images.

Yes, find me an IBM clone that has anything higher then 12V in the power
supply so you can reach your voltage in excess of 7V for example.

You make a bunch of hypotheticals that can't be substantiated and then
expect people to take you seriously.

My advice to educate yourself was serious, you are stupid for ignoring it.
Get a few data sheets, fix a few drives, make a few Prosys cables, measure
a few voltages, then get back to us. As it is, you just plain don't know
what you are talking about.

That's wonderful news!!! Whoo hoo!!

I still have a place in my heart for the Scott Adams advnetures. You are actually thinking of getting the graphical adventures on cartridge? That would certainly speed things up considerably.

>>> My personal technician refuses to work on the
>>> Drive because he says that it is too old and not
>>> worth the trouble.
>>>

My solution was to ultimately get some APE interface solution going.

I have a disk drive that works fairly good, but I don't want to wear it in
the ground, and when I returned to the Atari 8-bit scene in late '99, I started
using a 1050 extensively. This worked... alright. But after being used every
day for loading BobTerm for my BBS'ing and checking E-mail, this tended to wear
on the drive a little.

Then I bought a SIO2PC cable from Jason Worley. Of course, Steve Tucker
also sells the cable as well. I highly suggest it, and from either of those
two, since they are both quite friendly and professional.

I have named the cable actually a "SIO2ST" cable, since it goes from my
Atari 400 to a 1040ST. The cable and a program called 800XLDJ allows the
Atari8 to make use of the AtariST's hard drive.
Now I boot up with the vitual drives on 800XLDJ and let my poor 1050 rest.
;)

If you do not have an Atari Peripheral Emulator (APE) solution working, I
suggest looking into it.

>I've always thought too that DOS 3 wasn't quite as bad as everyone says

Our 1050 came with DOS 2.0 and a coupon to send for 3.0 which was several months in coming. We eagerly anticipated that extra storage space and converted immediately when it arrived and abandoned it just as quick.

Many of our Autorun.sys files for menus and other DOS load binary files (many were games) did not function with 3.0. We went back to 2.0 and then adopted the Antic 2.0 Enhanced Mod until 2.5 arrived. This mod was read compatible with 2.0 but you could trash things quick by writing to the wrong disk - I became very proficient with Messina's DiskTool!

-Ron

I don't have a solution but I admire the problem.

Takes some soldering. Bob Wooley did the upgrade for a color monitor, but
IIRC the EGA actually syncs to a standard CGA type output.

You can find the how to at. http://www.redshift.com/~cdyson/atari.html

The OSA+ DOS that came with the Induses included a high speed driver.
There's also SpartaDos X, which has a high speed driver as well.

I believe these drivers send a series of commands down the SIO chain,
telling any Indus drives they find to enter HS mode.

I used to have a dump of the SDX routine. Unfortunately, it was in the
proprietary SDX relocatable format, so I never did get a proper disassembly
of it.

Anyone out there have source for the Indus high speed routines?

3022. Re: How do you repair an Atari 1050 Disk Drive?

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-16 00:00:00 UTC
From: Atari Bob <ataribob@mindspring.com>
Message-ID: <8fsvns$8ih$1@slb6.atl.mindspring.net>
Source record: 44789

well..... on a general plane:

you pretty much need some known good spares so you can swap with the suspect parts.

I'll list a few common problems:
*the track zero sensor fails - the carriage drives into the inner stop and bangs away looking for track zero
*the hub clamp is too loose - the white thing that fits inside the drive hub of the diskette does not clamp the disk tight, allowing the disk to slip and run slow or not at all. a new belt will not help; shim the clamp with a piece of paper.
==>these problems will be fixed with a new drive mech.

*the speed control is usually pretty good - if it is off, you probably have a bad PCB
*there are a number of timing adjustments on the board - not a simple task; requires a scope.
*the rectifiers in the power supply overheat - bad capacitors or diodes in the power section.
*bad LSI chips - the 2793 or 6532 being most likely.
*bad 3086 transistor arrays
==>these require a new PCB or parts.

either way, the best approach if you can't see anything like a slipping hub or broken belt, is to swap out the whole drive. Then you have cut the problem in half....

3031. Re: DD Dos needed...

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-17 00:00:00 UTC
From: Rick D <74766.1561@CompuServe.COM>
Message-ID: <8ft7mq$2om$1@sshuraaa-i-1.production.compuserve.com>
Source record: 44798

```
--------------
I've had my 800 and 800xl for about 11 years now...
even tho I have had the DD disk drives, I've been stuck using the
SD
format, due to the OLD O.S. , I had the manual for the new os,
but I
never could find the software...
----------------------
O.S. refers to the rom chip in the computer-the software that
handles the hardware in the computer(6502, antic, pia, etc.).
True is was also on disk as the Translator.

DOS refers to the software that handles the disk drives-810,
1050, XF551, etc, and ramdisks. And yes, there was at least one
version of it on a rom that could be installed in the computer.

But they have very different purposes.

So I assume you really mean the the *DOS* you have is too old to
handle double density. Which means probably Atari DOS 2.0S or
2.5.

You could find Atari DOS 2.0D-it sort of handles double. But I'd
recommend MYDOS or SpartaDos. And there are others. But these
are the most popular disk drive software. They are available on

3032. Re: How do you repair an Atari 1050 Disk Drive?

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-17 00:00:00 UTC
From: Rick D <74766.1561@CompuServe.COM>
Message-ID: <8ft8mv$2om$2@sshuraaa-i-1.production.compuserve.com>
Source record: 44799

```
------------------------------
It makes the whoosing sound like it is running, but
all I get is a "BOOT ERROR" message scrolling
down my screen.
------------------------
Novice things:
Make sure the drive door is closed. Make sure the drive is set
to number one, and no other has the same number. Make sure the
disk is inserted with the label up and the oval cutout going in
first.

Advanced things:
Make sure the disk is spinning(a light papery scraping sound or
open the drive and look for real).

I'd use a damp, single-head disk cleaner(or open the drive and
use a swab carefully-keep the upper pad dry)-the head being
clogged with oxide is a main cause of not booting a disk.

Rick D.

What really happens is the code for high speed is downloaded to the
drive. The indus rom does have highspeed built in but it is buggy and
doesn't work.
>
> I used to have a dump of the SDX routine. Unfortunately, it was in the

All it is is a programm and data to dunp to the indus.

>
> Anyone out there have source for the Indus high speed routines?

The indus High Speed is the same as the XF high speed.
Set the high bit of the command and send command frame at 19200.
Send /receive data frame at 78000 (approx) (38000 approx XF).

A special version of DosXL was used. I did have it but lost it.
Does anyone have it??

The disks say DS DD. That doesn't mean they are Formatted in DD. More
likely they are formated in single density.

Yes, I had an XF551 that I purchased used maybe 5 or 6 years ago. I recently dug it out for a project, and found it would not read anything. Since I knew that it previously read/write fine, I cleaned the head with 91% Isopropyl and a cotton swab (not common rubbing alcohol!), and it started reading sporadically. Cleaned it again, and it started reading/writing perfectly. This is the 2nd XF that has shown this symptom. Have not had the same experience with any other type drive -- just the XF551.

Raphael James Espino <rje@co.umist.ac.uk> writes:

> Do you have any more info on the DOS 3 disk structure?

Yes and no. That's really a long long time ago, I'd to dig out the sources.
I could sent you a Dos 3 disk handler in assembly, if you're interested. It
was part of the "DUP" of my Dos.

IIRC, the general idea was the following: A group of 8 sectors is a block.
For each block on the disk, there is one byte in the file allocation table,
the FAT. It's somewhere stored in one of the early sectors of the disk, with
the directory following immediately to the FAT. The directory contains the
file name, the protection bits and the first block of the file. This block
relates in a simple way to a byte in the FAT, where this byte indicates the
next block of the file, or a EOF condition. The data blocks themselves do only
contain raw data, very unlike Dos 2.0S where they contain a file trace link
as well. This was moved into the FAT. This has the advantage that you only
need to load the FAT to point to a byte of a given index, and do not to load
all the data blocks of the file sequentially to locate the corresponding
sector. Therefore, POINT and NOTE references are always byte counts, which is
a good thing(tm). The only bad thing about it is the grouping of sectors into
blocks of eight to make the FAT fit into one sector. A more relaxed approach
to make one FAT entry relate to one sector at the cost of enlarging the FAT to
several sectors would IMHO have suited better.

So long,
Thomas

Source record: 44817

Howdy folks

I'm using a mini tower to power my BlackBox (and hold a hard drive and some disk mechanisms). But the fan's humming cancels out certain frequencies when the TV is on.

I once tried to disconnect the fan totally. It might have been coinsidence but after that my mini tower refused to work.

So now I came up with this new idea.

I believe most of the sould is not created by the fan itself but by the metal case of the tower vibrating at the same frequency. So now the plan is to mechanically isolate the fan from the case.

Anybody ever tried this?

What do you guys and girls think? Would a thin rubber ring help? Or do I have to replace the metal screws too? (metal conducts vibrations very well)

The only other solution would be to have a second fan rotate/vibrate at the same speed but with a phase shifted so that they would cancel each other out. Anybody have a clue how we might realise that. :-))

Not like I can understand, not do much with surprises me, given the
amount of help that comes with a full version of DOS 3.0. Unless of
course you couldn't do much with it due to compatibility problems.
Wasn't DOS 3.0 one of the few programs that actually used the XL help
key?

I think DOS 3.0 holds your hand a lot more than 2.0/2.5 does, but then
pays the price for that by being big, clunky, slow and a pain to use if you
already know what you're doing. Add to that incompatibility and those
1K clusters and it's not hard to see why it never took off.

That doesn't really help me much, not being and MS-DOS person =)

One thing I've always wondered about is how were sectors/blocks linked
together. Given that sectors were already clustered into blocks of 8,
was there still a link from every sector to the next even within a
block, or were blocks rather than sectors linked together, needing
only one link for each 8 sectors.

The 2nd scheme would mean you could squeeze an extra few bytes into 8
sectors than you could in 2.0/2.5, which might explain why it was done
that way. However from what I can remember of experiments many
years ago, each block only seemed to hold 1000 bytes of data, which
suggests 125 byte sectors like 2.0/2.5. And then there's sectors
1024-1040 which can't be used by a standard 2.5, but I guess 3.0 does
actually use.

I guess what it boils down to is why cluster sectors into blocks of 8?
There must have been some sort of reason for that, however twisted!
DOS 3.0 is very wasteful for small or medium size files, but is it any
better at big, disk sized files? Or did Atari have plans to introduce
bigger drives along with the later XL models that would have made the
waste less of an issue? Or is it just because dividing/multiplying by
1000 is easier for people than by 125? =)

For waht it is worth. I saw the prosys designe and thought Naaaaa.
I have several MAX238 chips around. A quick look at the MAXUM site got
me the pinouts and made a prosys cable with it. 5v is from an external
source.
My sio2 pc cable is the 2 chip type.

Mark,

You are in luck. There is a program called 800 XLDJ that I have been
building a good use for. It requires a Atari ST/STE/Falcon (would love to see
this tested on an Atari TT) and a SIO2PC. You can find the program at:

http://wwwstud.ira.uka.de/~s_tomczy/dj800.html

All and all, a well done program. If you have any questions, feel free to
ask, since I have gone through the trouble of asking most of the questions
about it one could hope to ask.

Hi,

I've replaced the 3086 now and it's made no difference.
The drive will still power up and seek but there it behaves as if the
SIO cable is not plaugged in.

What other chips could I replace to try and fix it?

Thanks in advance (again).

Indeed, what it needed was the ability to set block sizes when
formatting. On the plus side, the disk format was many times faster than
DOS 2.x for certain operations due to the FAT-like approach you mention.

DOS 3 has other advantages as well: an excellent online help system, a
very clean menu interface, and XIO options to format disks to odd
capacities and run binary programs.

> Do you have any more info on the DOS 3 disk structure? It is

I wrote a RAMDisk for DOS 3.0 and used it for years. It was almost
trivial. The call to the SIO occurs in exactly one place, so I just
loaded an assembly subroutine above KCP.SYS, changed the JSR to my
routine instead of SIO, and set up the low memory pointer and the reset
vector. Formatting was no problem, since XIO 253 allows you to format a
64k disk just fine.

As another poster noted, it allows them to fit the FAT it one sector.
Other advantages of large cluster sizes include speed and more efficient
disk usage for large files. The use of a fat makes some operations (like
deleting files) nearly instantaneous. After using it for a long time,
DOS 2.0 and 2.5 seemed really slow and clunky, although they use less
RAM (due in part to missing features).

Hello:

I formated them in DD using DOS 2.5, if that is possible. I forgot if used SMARTDos or 2.5 on these, because they are autorun.

>The disks say DS DD. That doesn't mean they are Formatted in DD. More
>likely they are formated in single density.

Hi,

I guess that is what my drive is, because it was advertised as a regular 810
but worked using DD disks.

>>I have never heard of a mod like that! Does it have a Happy in it?<

Hi,

Oh, absolutely, I would enjoy that. 2.5 is starting to P.O. me. Here is my mailing address:

Jessica Cornn
104 Scruggs Street
Berea, KY 40403

Would you like anything in return, $ for S/H, etc? Let me know.

-Jessica-

If I remember correctly it was 'Firebird' the software arm of BT did the non
BBC versions. They strted with the CBM version, then did the Speccy. The MSX
and the Amstrad versions were next but I am not sure which order or if they
ever came out for sure. After that they toyed with an atari version.
A friend at the time swore blind that he saw it running, very badly
(visiting elder brother who worked for firebird). They ported the CBM64
version then tried to get it to work, and it didn't work very well. So there
was talk of a re-write. but with the ST just around the corner most atari
programers seemed to be unavalible (busy with assemble languages on their
Sinclair QLs apparently, to give you an idea of how late they were working
on it) so it was shelved never to re-surface.
Thats the story I've heard.

Someone should have a go at converting the Beeb version.

Would take some time to disassemble I'm sure but it shouldn't be too
hard to isolate the system specific stuff.

RB.

It is unlikely that 2.5 could do DD, but remotely possible if someone applied
the old 2.0D mod to it...?

You cannot differentiate density by a directory on an empty freshly formatted
disk (unless using TopDOS which reports density) because both will say "707 or
8 Free Sectors". After writing DOS files, you can tell by the length of
DOS.SYS; single density will be about 37 sectors and double will be about 18.

-Ron

I don't have a solution but I admire the problem.

Check out the files in
ftp://ftp.spudster.org/pub/atari/CTH/Audio/Digitized . There's a
couple of the files you were talking about. They are converted to .WAV
format and resampled so that the filesize is a bit more reasonable. If
you have both the RAM and HD capacity, you should be able to play them
back with that sound utility I was talking about. They are between .5
and .75 megs. Even if you only have 256k of RAM, you will at least be
able to listen to part of them.

>of the Lucasfilm games Rescue on Fractalus and Ballblazer, i have the original
>versions that have the great intros to them, but when i try to copy these ones,
>the DOS copier cannot read them, it reads them as bad sectors, any ideas,
>sector copying didnt work either.

Maybe getting the disk images that were recently dug up of these games
(the real ones with the cool intos) is your best bet.

You couldn't have formatted in "DD" with DOS 2.5, the DOS just does not support it. The problem is in terminology: DD or Double Density means 256-byte sectors. When Atari brought out the 1050 they saved (according to Bill Wilkinson) about $2 in hardware by coming up with a custom format using 128-byte sectors with 26 sectors per track instead of using 256-byte sectors with the normal 18 sectors per track. Unfortunately, some marketing type came up with the term "1050 Double Density" which, if you remove the "1050" qualifier, is a flat-out lie.

You will see "1050 Double Density" referred to as "Enhanced", "Dual", or just "1050". In all cases, it means 128-byte sectors.

Is American Techna-Vision still around? They used to be a
good source of serial (SIO) cables.

If they're not around any more, what's the next best place
to get SIO cables?

Nick
